This document will quickly introduce you to the wonders of the MallinCam SkyRaider AG1.2C Camera. It will include instructions on how to install the Software and Drivers and how connect the SkyRaider to your computer along with explanations of the camera’s major settings. The purpose of this guide is to quickly get you up and running with the SkyRaider Camera so that you can image.

1. Introduction

The New SkyRaider AG1.2c Imager-Guider is the most affordable camera in its class. Packed with stunning features such as the IMX224 sensor, it can perform very well as an imager. The camera can be used as a guider or an imager for Lunar, Planets, Solar and Deep sky objects or as a video EAA. Using the highly acclaimed IMX224 CMOS sensor, the camera deliver sharp images and provides superb accuracy when used as an auto-guider.

The New SkyRaider AG1.2c is the most affordable astronomical camera ever offered and it is a MALLINCAM design.

Fully ST-4 compatible, Native WDM drivers for easy connection with 3rd party guiding software. By utilizing the MALLINCAMSKY Software Application Dark Frame Correction feature, an internal Peltier cooler (TEC) is not needed. This results in the use of only a single cable from the camera to the computer's USB 2.0 port. The Dark Field Correction feature removes all hot pixels, warm pixels, amp glow and most dark current noise on the fly making this premier astronomy camera the idea choice in the field or in an observatory. The dark field correction technology has been implemented by MallinCam for all their SkyRaider Series of camera eliminating the need of a Peltier cooler.

Special thanks to Jack Huerkamp and Rock Mallin whose expertise and experience are way beyond my capabilities.

So thank you for your purchase, and let the adventure begin.
The Contents of the SkyRaider-AG1.2C Package

Specifications:

- Live Stacking on the Fly
- Live Star Registration, Ideal for all Motorized Alt-Az mounted telescopes
- Passive Sensor Cooling
- Carefully Selected Sony IMX224 CMOS sensor
- Sensor Sensitivity: 2350 mv
- 3.75X3.75 pixels size
- 1280 X 960 resolution and 640X480 resolution mode
- 1.2 Mp sensor, 1/3" size (6 mm)
- Protective sealed Window with Double-sided AR coatings
- All Aluminum CNC construction for durability
- Exposure up to 16+ minutes
- MALLINCAMSKY Software Included
- 1.25" threaded adapter included
- ST4 guiding cable included
- 15 feet USB cable (5 meters)
- Aluminum CNC housing with built-in passive sensor cold finger offering thermal heat transfer from the sensor to camera body
- Dedicated astrophotography software to support live video, imaging, image stacking, and more
- MallinCam unique Dark Field Correction (No Peltier Cooler needed)
- Built-in ST4 auto-guider port
- 2.2 oz (65 grams)
- 2.5 Inches long
System Requirements:

- Equal to Intel Core2 2.8GHz or Higher
- Memory: 4GB or More
- USB port: USB 2.0 Port
- Display: 17" or Larger Recommended

In the Box

The SkyRaider AG1.2C Plus includes the following standard equipment:

- MALLINCAM SkyRaider-AG1.2C Camera
- Mallincam SkyRaider CCD with Software
- High Precision 1.25" Eyepiece Adapter
- 5-meter long. (15.5 feet long) USB 2.0 high grade cable
- SkyRaider-AG1.2C also includes a 2 meter ST4 Guider cable.

Note

Updated Software and Drivers can be downloaded at the Software Downloads Window located in the Support Tab at www.mallincam.net
2. Installing Driver and Software

System Requirements

PC running either Windows® (32-bit & 64-bit) XP, Vista, 7, 8, 8.1, 10, Mac, Linux

Performance is not guaranteed if the following specification cannot be reached.

- DirectX 9.0 or later installed
- 2.8GHz processor (Recommend dual core 2.8GHz or more)
- USB 2.0 Port
- 4GB RAM (Recommend 4GB or more)
- 200MB Free HDD

Installing the Software

Visit the Software Downloads Page in the Support Tab located on the website: www.mallincam.net

Select the Blue **Click Here** Button to download the Drivers and MallincamSky Software for a Windows PC (there is a **Click Here** that contains a ASCOM drivers as well as DSHOW and TWAIN Drivers).

After you have clicked on the Blue **Click Here** indicator, a zipped file will be downloaded onto your computer.
If you have a Mac, or Linux computer, just choose the appropriate download form the download page. The following instruction will represent a Windows Computer.

Make sure that the SkyRaiderAG1.2C is **not plugged** into the computer before completing the next step.

Place your mouse on the zipped file, **Right-Click** to pop-up an **Action Window**, and choose **Extract All …**

![Screen Shot](image)

A **Select Destination and Extract Files** Window will open-up. Just **Click** on the **Extract** button to accept destination location. The Destination Folder will now open-up the actual folder that contains the software to install.

![Screen Shot](image)

**Double-Click** on the folder to open it up, revealing the MALLINCAMSKYSetup program it contains.

![Screen Shot](image)

**Double-Click** on the MALLINCAMSKYSetup File

Windows may display a warning asking for permission to run the program, if it does, select **YES**.

The following **MallincamSky Setup Screen** will then appear:
Click on **Next** to start the installation process.

The installation program now wants to know where you would like to install the software. Either choose your own location, or select the **default**.

![Image of installation screen]

Click on **Install** to proceed.

Windows may again ask for permission to install the device software.

![Image of permission screen]

Click on **Install** to accept.

The **MallincamSky Software** will take about a minute to be installed. When completed, the following screen will appear:
Click on **Finish**, and the **MallincamSky** program will start-up and its window appear on your screen.

Now you can plug in the SkyRaiderAG1.2C into your computer (see the next Chapter called "**Connecting the SkyRaider**" for more details). It will take a moment for **Windows** to attach the drivers to the port, then you are ready to start imaging.

You can determine is MallincamSky recognizes the camera (and thus the drivers) by noticing the **SkyRaiderAG1.2C** name in the **Camera List** Tab (see Chapter 3 for detailed instructions).
3. Connecting the SkyRaider

Connecting the SkyRaider-AG1.2C to your Computer

Remove the rubber dust cover from the front of the SkyRaider-AG1.2C camera (place it back in the box for safe keeping).

Screw in any focal reducers (if using) to the 1.25" adapter to the front of the SkyRaider-AG1.2C.

Insert the SkyRaider-AG1.2C (with adapter attached) into the 1.25" eyepiece adapter on your Telescope.

Depending upon the telescope, you may need extenders so that you can reach focus with your telescope. It is recommended that you set this up in the daytime so you can see what you are doing (plus can aim at an easy to find tree or telephone pole).
Attach the 5 meter USB 2.0 Cable from the back of the SkyRaider AG1.2C to a free USB 2.0 port on your computer.

The SkyRaider AG1.2C has some strict power and thru-put requirements, and not all computers are created equal. If you find you are having difficulties with the following steps, it maybe the USB 2.0 port on your computer. If that is the case, one option to try is; connected a Powered USB 2.0 Hub to your USB 2.0 port on your computer. This simple step, can improve, both thru-put, power and distance between your computer and the SkyRaider AG1.2C camera.

Windows will then automatically load the correct SkyRaider Camera Driver onto your computer.

Once the driver has been successfully loaded, you will see the name of the SkyRaiderAG1.2C Camera in the MallincamSky Camera List on the upper left of the Window. You can install more than one SkyRaider Camera to your computer, but the software can only control one SkyRaider Camera at a time.
Connecting the AutoGuider Cable to the SkyRaider-AG1.2C

If you are going to use your SkyRaider AG1.2C as an AutoGuider, then you will need to attach the provided ST4 cable.

Attach one end of the ST4 cable into the ST4 slot on the back of the SkyRaider-AG1.2C, and the other end into the ST4 port on your Telescope Mount.
4. Using MallincamSky Software

The MallincamSky Window

The MallincamSky Software Window is segmented into a few regions to make viewing and adjusting the SkyRaider camera easy and intuitive.

1. The Top Menu Line provides dropdown menus and icons to allow you to make major settings of the software.

2. The MallincamSky Left SideBar provides the simple click activation and selection capabilities to control all aspects of the image and camera.

3. The Left SideBar Base provides selection options for Camera, Folders, or Undo. Left Clicking on the selection choice will fill the Left SideBar with its options.

4. The Video Window will contain the display image from the SkyRaider Camera. It is here that you will see the live video, or images.

5. The Information Line will indicate the current camera, current frame rate, number of frames displayed, resolution, information about captures, etc.
SkyRaider AG1.2C with MallincamSky.

A typical workflow when using the SkyRaider AG1.2C with MallincamSky.

1. Start Mallincam
2. Deep Sky Object
3. Video Mode to Image
   - Video Mode to Focus
   - Trigger Mode to Image
   - Activate Dark Field
4. Take Dark Field
5. Live Stack
6. Adjust Image
7. Save and Record
8. Exit Mallincam
   - Exit Mallincam
   - Save and Record
   - Adjust Image
   - Live Stack
   - Activate Dark Field
   - Trigger Mode to Image
   - Video Mode to Focus
   - Video Mode to Image
Live Stack Pictorial Work-Flow

A typical workflow when Live-Stacking with MallincamSky.

1. Expose Object
2. Choose and Activate Video Mode or Trigger Mode
3. Live Stack
4. Choose type of Stacking
5. Adjust Image
6. Save and Record
Dark Field Pictorial Work-Flow

A typical workflow when taking a Dark Field with MallincamSky.

1. Determine Maximum Exposure
2. Choose and Activate Video Mode or Trigger Mode with Maximum Exposure
3. Choose Quantity and Click Capture to Take
4. Check Enable Box
5. Capture Images
Histogram Pictorial Work-Flow

A typical workflow when using the Histogram Command with MallincamSky.

1. Expose Object
2. Select Histogram
3. Select Exposure
4. Increase Left number or Move Left Bar in to Darken.
5. Increase Right number or Move Right Bar in to Brighten.
6. Decrease Exposure
7. Increase Exposure
8. Histogram Moves to Left
9. Histogram Moves to Right
ROI Pictorial Work-Flow

A typical workflow when using the ROI Command with MallincamSky.

1. Expose Object
2. Trigger Mode
   - Stop
3. Video Mode
4. ROI
   - Apply
   - Defaults
5. Video Mode
6. Trigger Mode
   - Loop
Save Image Pictorial Work-Flow

A typical workflow on how to Save an Image with MallincamSky.

Expose Object

Save As...
Record Video Pictorial Work-Flow

A typical workflow on how to Record a Video with MallincamSky.

1. Expose Object
2. Options -> Preferences...
3. Enter File Location, Format, Prefix, Type, Number of Seconds
4. Number of Videos, Time between each Video
5. If No Time Limit Set

Video Mode to Image
Batch Record Pictorial Work-Flow

A typical workflow on how to **Batch Record** a series of **Videos** with a single **Click**.
Auto Capture Pictorial Work-Flow

A typical workflow on how to Auto Capture a series of Images with a single Click.

1. Expose Object
2. Choose Exposure Time
3. Enter File Location, Format, Prefix, Type, Capture Mode, Total number of Images from Options/Preferences
4. Done
Save Sequence of Images Pictorial Work-Flow (Trigger Mode)

A typical workflow on an alternative method to Save a Sequence of Images with the Sequence Command in Trigger Mode with MallincamSky.
More Detailed Work-Flow Procedure

Quick Workflow for MallincamSky

So, you don’t like to read manuals, and you just want to just jump right into imaging. Then this section gives you a Quick and Dirty method to get going. Then, I follow this section with an even more detailed section on Planetary Imaging Workflow, and finally a more detailed section on Workflow on Imaging Deep Sky Objects.

The Mallincam SkyRaider AG1.2C Cameras provide a processing technique called Dark Field Correction (see the Section Dark Field Explanation in the Appendix for a complete description of Dark Field Correction).

Double Click on the MallincamSky Icon to start the program.

Select the SkyRaiderAG1.2C from the Camera List in the Camera Tab.

With the Camera Tab selected on the Left SideBar, Left-Click on the SkyRaiderAG1.2C (between lines in Camera Heading). Once the SkyRaider is selected, a black rectangle (with SkyRaider Camera name) will appear in the Video Window of the MallincamSky Software along with the Horizontal and Vertical Rulers.

If you are imaging planetary objects, jump to Step 6.

Select an Exposure Time for Dark Field Correction

With the Camera Tab selected on the Left SideBar, Left-Click on the Capture & Resolution. The Exposure & Gain Window will expand select the exposure time for the Dark Field.

You must determine what you believe will be the maximum exposure for this session. As, you will create Dark Field’s with this time (or close to it).

If you are taking a maximum exposure under 5s, then select Video Mode, but since most Deep Sky Objects will require an exposure of over 5s, choose Trigger Mode.

Either enter in the time into the appropriate boxes, or use the up and down arrows beside the chosen Exposure time unit to set your maximum time.
Take Dark Field Correction

Ensure that the Lens Cover is either on the SkyRaider Camera or the Telescope itself is Covered (Cap is on), then Left-Click on the Dark Field Correction Line.

The Dark Field Correction Line will open up allowing you to select the Quantity of Dark Fields and the option to start the Dark Field Capture process.

Select up to 99 for the Quantity (Start with 5 exposures to get a feel of the process). Then Left-Click on the Capture Button. The Software will display its progress above the selected Quantity. Remember, it is beneficial to set the Dark Field exposure time greater than the longest time you will be imaging at, and try to match the gain settings you will be using.

As the Dark Fields are being exposed, you can watch the exposure counter in the Dark Field Correction Tab go up, and located on the bottom right side of the MallincamSky window, you will see a counter letting you know how long is left in that particular exposure.

Once the Dark Fields have been taken, you have the option of saving (so you can use them again on another night) them with the Export button in the Dark Field Correction Tab.

You can import previously saved Dark Fields by using the Import Button.

Now, Left-Click in the Enable check box in the Dark Field Correction’s box to have Dark Fields applied in real time to your images.
Reduce Exposure Time to Align Telescope

As you will most likely use the camera to align your Telescope, now is the time to reduce the Exposure Time to 1 or 2 seconds, and if not already attached to the Telescope, remove the lens cap from the SkyRaider Camera and insert the c-mount on front end of the camera and slide camera into eyepiece holder of telescope. The shorter exposure will make it easier for you to align and focus your telescope.

Left-Click on the STOP button in the Trigger Mode screen, and now select Video Mode. Move the slider (or enter the time) to some value less than 5 seconds (note that the units are in milliseconds, so 1 second = 1000 ms), and align and focus your telescope. In Video Mode, images are continuously taken.

Increase Exposure Time to Image

Now is the time to expose some Deep Sky Objects or Planetary Objects. So, go back into Trigger Mode (if you are imaging Deep Sky Objects, else remain in Video Mode if imaging Planetary Objects) and adjust the Exposure Time to match the current target and the equipment you are using.

If you have enabled the Dark Field Corrections for this session (Dark Fields are stored directly in the SkyRaider Camera and will be deleted when the camera is turned off), the SkyRaider will automatically apply the best Dark Field Correction to your image when Dark Field Correction is enabled.

Adjust the Parameters

Choose a parameter from the Camera Tab on the Left SideBar and see what you can adjust, and how it affects your image.

You will have to wait until the next image is exposed to see how your adjustments look (keep an eye at the bottom of the screen to see when the next adjusted image will appear).

Have Fun and Experiment

You can now spend some time to become more comfortable with the MallincamSky Software. The SkyRaider AG1.2C User Manual will go into more detail about all the options and adjustment you can perform with the SkyRaider series of cameras. But, don’t be afraid to experiment.
Detailed Workflow of Video Imaging Planetary Objects

The following instructions will guide you in setting up your SkyRaider camera for imaging Solar, Lunar, or Planetary Objects.

For planetary objects, the exposure setting will be very small (as the objects themselves are usually very bright). It is recommended that you start imaging objects, such as the Moon and planets, as it will allow you to become comfortable with all of the adjustments that MallincamSky provides for you. With planetary objects, you want as much resolution and data as possible, so choose the highest resolution your SkyRaider provides (which is easy as that is set for you).

Since the exposure rate is so short, you may find that you do not need to take any Dark Fields preparation shots before imaging. But, if you do notice warm pixels and would like to eliminate them. Then follow the step-by-step instructions located in the section called: Dark Field Correction later in the manual.

The following instructions are used as a guide to assist you in doing planetary video imaging. Don’t forget, when finished with a particular step that uses a particular feature Tab, you can close the Tab (This will remove, the green and blue boxes which may be displayed over your image) by Clicking on the little up- arrow in the right corner of that Tab.

If not started, Double Click on the MallincamSky Icon on your Desktop to start the program.

Select the SkyRaiderAG1.2C from the Camera List in the Camera Tab.

With the Camera Tab selected on the Left SideBar, Left-Click on the SkyRaiderAG1.2C (between lines in Camera Heading). Once the SkyRaider is selected, a black rectangle (with SkyRaider Camera name) will appear in the Video Window of the MallincamSky Software along with the Horizontal and Vertical Rulers.
Have your telescope pointed to the Planetary Image of interest, and it is recommended that you use a Barlow Lens attached to your Telescope to provide a “Larger (Longer Focal Length)” image.

Since you will want to “push” the capabilities of the SkyRaider in displaying the Planetary object, you will require the highest resolution that your SkyRaider can produce, along with the largest bits of data (for color or shades of Back and White) for each pixel that the SkyRaider can produce. This will provide enough data for external stacking programs to pull out the finest detail from your video images.

From the Capture and Resolution Tab on the MallincamSky ToolBar, and select the Largest resolution values that your SkyRaider can produce.

The SkyRaider AG1.2C currently has two resolutions: 1280 x 960, and 640 x 480.

If you are going to be saving and processing images taken with the SkyRaider, you may want to increase the Bit depth to the highest value your SkyRaider camera supports.
Step 6

With MallincamSky running, **Left-Click** on the **Capture and Resolution Tab** to expand the exposure window.

- **Click** in the **Video Mode Selector** to choose **Video Mode**.
- **Start with the Gain Slider** all the way to the Left.
- **Make sure that the Auto Exposure CheckBox** is unchecked.

The SkyRaider AG1.2C has two exposure modes:

- **Video Mode**
- **Trigger Mode**

Since we are imaging planetary objects, our exposure should not exceed **5 seconds**. Therefore, we will be using **Video Mode** exclusively for setting our exposure times. **Video Mode** will continuously take and display images at the duration you set in the Exposure time.

**So, let’s get started:**

- **Set your exposure to a small value**, say **10ms** as a starting point (we are using a small time, but the actual exposure amount depends upon the f/ratio, size of telescope, filters, seeing conditions, ...). You can adjust the exposure using one of the three methods below:

  o You can either use the **mouse button** and **Left-Click-Hold and Drag the Slider Marker** (This method is best for making large movements).
  o You can also **Click** on the **Slider Marker**, then use the **Left** and **Right arrows keys** on your keyboard to precisely move the **Exposure Marker** (this method provides the most accurate tiny adjustments to the exposure times).
You can Click on the **Exposure Time**'s current setting and a pop-up window will appear that allows you to enter the required exposure time in milliseconds (This allows you to be very precise in the exposure time you require, **5000 ms = 5 seconds**).

You should be able to see the Planetary object of interest on your screen. So now adjust the **Exposure Time** to make the object bright enough to match your viewing requirements. You can also adjust the **Gain** to the **Right** to brighten your image.

**Step 7**

Now is the time to adjust the **Color Balance** and **Color Adjustment** (Contrast, Gamma, ...) to your required preferences.

![Color Balance and Color Adjustment](image)

Read the appropriate section in the **User Manual** (it is great reading, if I do say so myself) to obtain more information what each particular camera setting does in the **Color Balance** and **Color Adjustment** Tabs in MallincamSky. There is no precise value for every user, as we all use different equipment. This is a great time to ‘**play**’ with the settings to see what value work best for you. Just have fun.

**Hint**

To improve the Though-put (**Frames per Second**) or if you want to isolate the planetary object, choose a **Region of Interest** (**ROI**) that just includes the image of the planetary object.

You select the **ROI** by using **Left-Click-Hold and Drag** the handles of the **Blue Rectangle** that will appear over your **Image Window** when you selected the **ROI Tab**. Once you have framed the **Blue ROI Rectangle** over your image, **Click** on the **Apply** button in the **ROI Tab** to accept it.

![ROI](image)
This will make the Video Screen contain just the object that was enclosed by the ROI’s Blue Rectangle. To return to Full Video Mode, just Click on the Defaults Button on the ROI Open Tab.

Using the Scroll Wheel on your mouse, when the mouse is over the Image Window, will enlarge and reduce the image size in the Image Window.

To finely adjust the image characteristics, open up the Histogram Tab, and either enter in the Left and Right values, or Left Click, Hold and Drag the two Vertical Bars so that you are not clipping data, on either side of the window. These adjustments will help improve the image on the screen. The Histogram Tab will take a bit of practice to become comfortable with it (read section in the User Manual covering the Histogram Command). Set the exposure so that the peak of the histogram is someplace between 50 and 100.

For any Exposure over 3 seconds (3000 ms), you can determine how long your camera’s exposure time has left by looking at the lower right hand corner of the MallincamSky’s Window. It will provide a real-time indicator that informs you of the current time remaining of the exposure time that you had previously set.

The example on the left is telling us that we have 2 seconds remaining on our 5 second (5000ms) exposure.
If you have created **Dark Field Corrections** for this session (**Dark Fields** are stored directly in the **SkyRaider Camera** and will be deleted when the camera is turned off), then when you enable the Dark Field corrections, the **SkyRaider** will automatically apply the best **Dark Field Correction** to your image.

Remember to enable **Dark Field Correction** just check the **Enable Button** in the **Dark Field Tab**, to disable **Dark Field Correction**, just un-check the **Enable Button** in the **Dark Field Tab**.

Again for most planetary imaging, **Dark Fields** will not be necessary.

Go into **Options** from the **Top Menu Line**, and choose **Preferences**. It is here that you can set options for the **MallincamSky**. If you go into Misc., you can change the Color Style of the **MallincamSky** software. If you select another **Color Style**, **Apply**, then **Left-Click** on **OK**. Choose the **Color Style** which works for you. (Use a bright **Color Style** if using computer in Daylight).

**Detailed Workflow of Video Imaging Deep Sky Objects**

The following instruction will guide you in setting up your SkyRaider AG1.2C camera for imaging **Deep Sky Objects (DSO)**.

For Deep Sky Objects, the exposure setting will be very large (as the objects themselves are usually very dim). It is recommended that practice imaging objects, such as the these, as it will allow you to become comfortable with all of the adjustments that MallincamSky provides for you. With Deep Sky Objects, you want as much resolution and data as possible, so choose the highest resolution your SkyRaider provides.

Since the exposure rate can be very long, you will need to prepare your system by taking **Dark Fields**. If this is the first-time imaging DSO’s, you may not have saved previous **Dark Fields**, so this Walk-Through will take you through the Dark Field preparation step.

Remember complete explanations of each of the processes and controls are provided later in the User Manual.

The following instructions are used as a guide to assist you in doing Deep Sky imaging. Don’t forget, when finished with a particular step that uses a particular feature tab, you can close the Tab by clicking on the **little arrow** in the corner of a Tab (This will remove the green and blue boxes which may be displayed over your image).
Have your SkyRaider connected to your telescope, and since you are video imaging Deep Sky Objects, you should have a **Focal Reducer** attached. This will provide you two benefits: first you will be presented with a larger field of view (see more of the object), and second, you will have a faster telescope (shorter exposure times).

If not Started, **Double Click** on the **MallincamSky Icon** on your Desktop to start the program.

Select the **SkyRaiderAG1.2C** from the **Camera List** in the **Camera Tab**.

With the **Camera Tab** selected on the **Left SideBar**, **Left-Click** on the **SkyRaiderAG1.2C** (between lines in **Camera Heading**). Once the SkyRaider is selected, a black rectangle (with **SkyRaider Camera** name) will appear in the **Video Window** of the **MallincamSky** Software along with the **Horizontal** and **Vertical Rulers**.

Since you will want to “push” the capabilities of the SkyRaider in displaying the Deep Sky Object, you will require the **highest resolution** that your particular SkyRaider can produce, along with the largest **bits of data** (for color or shades of Back and White) for each pixel that the SkyRaider is able to produce. This will provide enough data for external stacking programs to pull out the finest detail from your video images.

From the **Capture and Resolution Tab** on the **MallincamSky ToolBar**, and select the **Largest** resolution values that you SkyRaider is capable of.
The SkyRaider AG1.2C currently has two resolutions: 1280 x 960, and 640 x 480.

If you are going to be saving and processing images taken with the SkyRaider, you may want to increase the Bit depth to the highest value that your particular SkyRaider camera supports.

Due to the Large Exposure times you will be using in imaging Deep Sky Objects, the SkyRaider (in fact every camera no matter what the cost) will sometimes display noise such as, warm pixels and amp glow. The longer the exposure the more noise that can appear on your image. The MallincamSky software can remove this noise, by applying pre-prepared Dark Fields to your images, effectively removing the noise.

Either place the Lens cap over your Telescope, or place the dust cover cap over your SkyRaider AG1.2C camera to block any light from hitting the sensor of the camera.

Open the Dark Field Correction Tab on the Left SideBar of MallincamSky. You will normally determine the maximum exposure time that you will be using for the evening, but to get started for the first time, we will choose 5 exposures of 30 seconds. Adjust the Quantity to 5.
Select an Exposure Time for Dark Field Correction

With the **Camera Tab** selected on the **Left SideBar**, **Left-Click** on the **Capture & Resolution** (if you are in **Video Mode**, a **Green Rectangle** with the word **Exposure** will appear in your **Video Window**).

You must determine what you believe will be the maximum exposure for this session. As, you will create Dark Field’s with this time (or close to it). In this example, we will choose **30 seconds**.

In the **Capture & Resolution** Tab; **Click** on the **Trigger Mode Radial Button** (Trigger Mode is used to select any exposure time over 5 seconds).

Move the **Gain Slider** to about where you would normally use it (start with **10** if not sure).

Either enter in the time into the appropriate exposure **time unit boxes**, or use the **up** and **down** arrows beside the chosen Exposure time unit to set your maximum time. For us, set the seconds (**s**) time unit to **30** for 30 seconds.

Since we have chosen **30 seconds**, you will notice, on the bottom right of the Main Window of MallincamSky, the **Time Left** indicator. This indicator shows you the remaining time of the current set exposure time when you are taking exposures.

The example on the left is telling us that we have **24 seconds** remaining on our **30 second** exposure.

Take Dark Field Correction

Ensure that the cover is either on the **SkyRaider Camera** or the Telescope itself is covered, then **Left-Click** on the **Dark Field Correction Line**.

The **Dark Field Correction Line** will open up allowing you to select the **Quantity of Dark Fields** and the option to start the **Dark Field Capture** process.
Select 5 for the **Quantity**, then **Left-Click** on the **Capture Button** (which will change its name to **Stop**, in case you need to abort the Dark Field capture). The Software will display its progress above the selected **Quantity**. Remember, it is beneficial to set the Dark Field exposure time greater than the longest time you will be imaging at.

As the Dark Fields are being exposed, you can watch the **exposure counter** in the **Dark Field Correction Tab** go up to let you know how many Dark Fields have been taken (2 out of 5 in the above example).

Once the **Dark Fields** have been taken, you have the option of saving them by **Clicking** on the **Export button** and saving them in a folder of your choice. This way you can use them again on another night.

You can also import previously saved **Dark Fields** by using the **Import Button**.

Now is the time to get busy with actually imaging our Deep Sky Object since the preliminary work is done. So remove the Lens Cap from the Telescope, or Lens Cover from the SkyRaider.

Hopefully, your telescope is mostly polar aligned, and you are ready to visit your first **DSO**, and produce an image to impress one friends, neighbors, and spouse (so you can justify spending all of your hard-earned money on those extra pieces of equipment that you just had to have for imaging).

The first thing we need to align and verify focus of our Telescope. To do that we only need a short duration exposure (under 5 seconds), so we will use **Video Mode**.

Open up the **Capture and Resolution Tab**, and ensure that the **Auto Exposure** box is **unchecked**. Move the **Gain** slider to about the same value you set in the **Dark Field**, say 5.

**Step 9**

**Step 10**

**Now** select the **Video Mode** Radial indicator button, then either use the slider or **Click** on the **Current Exposure Time Value** to open up the **Exposure Time Window**. Enter in 1 second (1000 ms) in this window and **Click** the **OK** button to accept.
We will use a small exposure so we can verify that the object is someplace in the field of view (if in using 1 second the star or object is too dim, increase exposure to 2 seconds). This is a great time to check your focus as the images will be updated very quickly. You can use the Crosshair’s Button at the top of the MallincamSky Window to assist in centering you object (or focus a star). Click on the Crosshair to activate, and again Click on the Crosshair to deactivate it.

If the image is too dim, try increasing the Gain.

Now, you have your Deep Sky Object (or at least a dim version of it, centered in your screen. It is time to crank-up-volume. Well, for us, time to increase the exposure time.

If the Capture and Resolution Tab is not open, then Click on it to expand its Window.

When imaging Deep Sky Objects, we will need to use an exposure over 5 seconds (5000ms), this is where the Trigger Mode comes in, on the SkyRaider AG1.2C.

- Click on the Trigger Mode Radial selection button to activate Trigger Mode.

- Set your exposure to a large value, say 30s as a starting point (we are using 30 seconds, but the actual exposure amount depends upon the f/ratio, size of telescope, filters, seeing conditions, ...).
You can adjust the exposure using one of the two methods below:

- You can **Click** in the **Time Unit Box** and enter in an amount (30 seconds) using your Keyboard.
- You can **Click** on the up or down arrow in the **Time Unit Box** of choice to move the exposure time to your required value (30 seconds).

**Click** on the **Single Button** to take a single exposure to see if the image of the object is close to the brightness you need.

If you are satisfied with the single image, then **Click** on the **Loop Button** to have the SkyRaider AG1.2C continuously take images (at 30 seconds in our example).

Since we have chosen 30 seconds, MallincamSky will continuously display the **exposure time** and the **current amount of time left** in the exposure info box located on the Bottom Right side of the MallincamSky Window (MallincamSky does this automatically for any exposure over 3 seconds).

The example on the left is telling us that we have 24 seconds remaining on our 30 second exposure.

Now, we are heading into the “Art” of video imaging. You can **decrease** the **Exposure Time**, as long as you **increase** the **Gain**. But, by increasing the **Gain**, you also **increase any noise** that is present. Use your own judgment in what you are willing to accept on your image.

Now, that we have an image that we are happy with, it is time to enable **Dark Field** subtraction (if you took Dark Field Images).

**Click** on the **Enable CheckBox** in the **Dark Field Correction** Tab. Dark Fields will be automatically applied during the next image refresh, so in our example you may have to wait up to 30 seconds before the Dark fields are applied.
Obtaining an Image of our First Deep Sky Object is enough for most to start the celebration process (again most of us will call for our spouse to have a look at the amazing image we have just produced, again trying to justify the money used in buying those extra pieces of hardware).

Next, we want to fine tune our image to perfection (at least that is what you will tell yourself), but this is a great time to get familiar with some of the adjustment options available in MallincamSky.

**Step 12**

Click on the **Color Balance Tab** and the **Color Adjustment Tab** to open them up and have access to the **Color Balance** and **Color Adjustment** (Contrast, Gamma, ...) settings to tweak your image.

| M57, 20 Seconds exposure, VRC 6”, F/4.5 with MallinCam 0.5X focal reducer, NO Dark Field Correction. No processing, as seen live on monitor. Single frame. | M57, 20 Seconds exposure, VRC 6”, F/4.5 with MallinCam 0.5X focal reducer, One Single DARK FIELD CORRECTION APPLIED LIVE, No processing, as seen live on monitor, Single frame. |
Read the appropriate section in the User Manual (it is great reading, if I do say so myself) to obtain more information what each particular setting does in the Color Balance and Color Adjustment Tabs in MallincamSky. There is no precise value for every user, as we all use different equipment. This is a great time to ‘play’ with the settings to see what value work best for you. Just have fun. The best part, is if the mess up, there is always the Defaults Button to bring your image back.

To finely adjust the image characteristics, open the Histogram Tab, and either enter in the Left and Right values, or Left-Click-Hold and Drag the two Vertical Bars so that you are not clipping data, on either side of the window. These adjustments will help improve the image on the screen. The Histogram Tab will take a bit of practice to become comfortable with it. For more detailed information on how to use the Histogram Tab, locate that section in the User Manual. Set the exposure so that the peak of the Histogram is someplace between 50 and 100.

Remember, every adjustment in MallincamSky such as Exposure, Gain, Gamma, Brightness, Contrast, … will not appear on the Video Window until the SkyRaider has done its next refresh (which depends upon the current exposure time).

This is where you must take over, as each telescope, night-sky, seeing conditions are different from user to user. So, have fun and experiment with the settings and see how they affect your image. Remember, these are your images and you decide what is best for you.
5. The SkyRaider Software Controls

This Chapter of the User Manual will describe in exact detail what each control on both the Top Line Menu and the Icon Toolbar does. This Chapter is best read on a rainy day, or can be used to jump to the specific section that describes how to use a particular control.
**Top Menu Line**

**File**

This **Drop-Down Menu** will allow you to **Load** and **Save** images, play video files.

---

**Open Image**

The **Open Image** command is used to open an existing image file. This command can also be used to preview an image in small size, or to view its statistics and information without actually opening the image itself. You can use this command to quickly locate a particular image on your computer. **MallincamSky** supports, and can open a variety of image formats. These are identified in the **Files of type** list box.

**MallincamSky** can open more than one image simultaneously by:

- **Ctrl + Left Mouse Click** on each required File, then **Left-Click** on **Open**
- **Shift + Left Mouse Click** method to highlight the files to be opened, then **Left-Click** on **Open**

When an image is opened, **MallincamSky** places it into a new image window and it then becomes the active image.

**Note**

**MallincamSky** maintains, at the **File>Recent Files** submenu, a list of the last opened files.
Open Video

Use the Open Video Command to open an existing video on your computer. The Open Video command is only enabled when no SkyRaider Camera is present when MallincamSky is started. Only a single video can be opened at a time. If the SkyRaider AG1.2C is active, then this Open Video command will be disabled.

Right-Click on Video [SkyRaiderAG1.2C] Title in Video Window, then choose Close. This will shut-down the video stream and allow you use the File>Open Video command.

Select the name of the file you want to open. If the file does not appear, select the option for showing all files from the Video Files Drop-Down Button. The video file type can be .wmv, .asf, or .avi format.

You can preview the Video by Left-Clicking on the Play Button on the Preview Window on the right side of the Open Window.
Click on the Open Button to open a video file, this will create a New Video Window and begin to start playing the video stream. The video window will be associated a name called “Video [XXX.XXX]” (i.e., its title bar will display “Video [XXX.XXX]”, here, XXX.XXX is the video file name). No sound will be heard when playing the video stream.

The Save command allows you to save the updated image (not live Video) onto your computer. The command immediately stores the current window image to its filename (the filename is listed on the window’s title bar) while leaving the image still active in its window.

If the image is untitled or titled with a digit, MallincamSky will issue the File>Save As dialog automatically. The default “Save as type” will be “Window Bitmap (*.bmp,*.dib,*.rle)”.

The File>Save command can be used to save the most recent changes to disk. It is often performed as a precautionary measure during lengthy or involved processes to reduce the amount of reprocessing that might be required in the event of a system failure or operational error.

When an image is being closed (Right-Click on Image title) and you have chosen not to save its changes from the Popup Window, MallincamSky discards all changes made since the last File>Save operation.

The File>Save command saves the contents of the entire window, unless if there was an ROI (Region of Interest) defined on it, in which case it will save the ROI contents. The File>Save command will be disabled if the file is not changed or the changes have been saved.
The **Save As** command allows you to save an image onto your computer with a specified file format. At the end of a `File>Save As` operation, the image window will be associated with the new file and the new format (i.e., its title bar will display the new file name). **MallincamSky** supports the following file formats:

- Window Bitmap (*.bmp,*.dib,*.rle)
- JPEG (*.jpg,*.jpeg,*.jpe,*.jif,*.jfif)
- Portable Network Graphics (*.png)
- Tag Image File Format (*.tif, *.tiff)
- PCX(*.pcx)
- Targa (*.tga)
- JPEG 2000 Standard (*.jp2)
- JPEG 2000 Codestream (*.j2k)
- MallincamSky File Type (*.tft)
- FITS (*.fit, *.fits)

The **Save As** command has several important uses beyond simply storing an image to a new file name. **Left-Click** on the **Option** button to select the different parameters to encode the file (based on selected **Save as Type**).

**JPEG**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image quality</td>
<td>If you save an image in JPEG format (*.jpg), you may adjust image quality in the edit box. The values range from 0 to 100. Default value is 75.</td>

</table>

For Bitmap (*.bmp), PCX (*.pcx), Targa (*.tga); There is no Option choices.
**Batch Save...**

The **File>Batch Save...** command will be enabled when:

- a) An image is opened.
- b) An image is captured from the camera using **Snap**.
- c) An image window is created by choosing the **File>Paste as New File** command.
- d) An image window is created copied from the **Undo/Redo** Sidebar.

To start the **File>Batch Save...** command, you have to:

1. Choose the **File>Batch Save...** command which will bring up a Batch Save dialog:

   ![Batch Save Dialog]

   - **Directory**: Enter the name of the drive and directory where your captured images will be saved. You may either type the path information, or use the Browse button to locate it from a standard Browse Folder dialog.

   - **Name Format**: The year, month, date, hour, minute and second or a number `nnnn` (sequence) are used as part of the filename. If more files are saved within a second when using a time format, a `(xx)` suffix is attached to the end of Name Format to avoid the possible name conflict. For the `nnnn` (sequence) “Name Format”, no suffix is needed.

   - **File Prefix**: Enter a file name prefix for Batch Save when generating files names for a series of images. This prefix will be combined with Name Format to form a final file name naming paradigm.

   - **File Type**: In this combo box, select the format in which you want the image to be saved (can be BMP, JPG, PNG, TIF). Click the **Option Button** to set the different parameters for encoding the file (For BMP format, the Option will be disabled. See **File>Save As...** command about the details of the format encoding methods).
Sample: The final file name is shown at the right of the Sample label for quick reference to see if you like it.

2. Once the settings are made, **Left-Click** the OK button to begin the file batch save process or **Cancel** to cancel the File>Batch Save ••• command and return to the application.

When the File>Batch Save••• command has finished, the **Title** on the Image Tab or Image Window will be modified with the file name formed in the Batch Save dialog.

The File>Batch Save••• will perform no saving operation if the file is not modified.

**Paste as New File**

The File>Paste as New File command will be enabled when there is valid image data on the clipboard first (see the Edit>Copy command). If there is no image data on the clipboard, the File>Paste as New File command will be disabled.

Choose the File>Paste as New File command to place the contents of the clipboard image into a new image window, which becomes the active image. The new image type will be the same as that of the original image.

This is useful for bringing in a previously saved image (that you have selected via the operating systems **copy command**) into the MallincamSky Image Window. You can modify the image properties via the **Image Menu** choice (see **Image** section in user Manual).

MallincamSky will accept image data from other applications via the clipboard as long as it is in Windows Bitmap (DIB) format.

**Note**

MallincamSky will assign a digit to the Paste as New File command in the created image window **Title Bar**.

**Recent Files**

MallincamSky maintains 4 (default) of the most recently opened document files under the Recent Files command. Choosing one of these submenus will reopen that file immediately.
The maximum number of Recent Files can be modified by choosing the Options>Preferences... command and clicking the Misc selection. Here, clicking the 4 (default) edit box will allow you to enter the number of the Recent Files Submenu that you want. The value ranges from 0 to 8, the default is 4.

One can also check the Clear the Recent Files when exit the application to clear the Recent Files after exiting the MallincamSky application.

Choosing the File>Exit command will close video, all of the image windows and Browse window and remove their windows from the screen. After all of the windows are closed, MallincamSky will end itself.

If an image has been modified before attempting to Exit, MallincamSky will issue a warning to ask if user wants to save the images or not.

This Drop-Down Menu will allow you to Cut, Copy and Paste Layers over your images. From the Edit Menu, you can also select a Region of Interest (ROI) from your image and copy it to the Windows Clipboard, or even de-select the ROI if you have changed your mind.
Cut

This command is or future implementation (I cannot find a use for this command).

Copy

This Edit>Copy command can be used to copy a selected part of your image (see Select Image command) to the Windows Clipboard. Then you can use another software’s Paste Command to place this selected image inside that software, or File>Paste as New File to paste into a new MallincamSky Window.

Using the Select Image command, you can select a region of your currently live image (using the Left-click Hold and Drag technique) then choose Edit>Copy (or Ctrl+C). Now you can Paste that selected image into another document (such as Microsoft Word, or Microsoft Paint) for later use.

Paste

This control allows you to place a Copied File (you have previously selected the File and then used Edit>Copy) into your currently selected folder. Remember to use File>Paste as New File to paste image into a new MallincamSky Window.

Paste Shortcut

This control allows you to place a copied File Shortcut (you have previously selected the File and then have used Edit>Copy) into your currently selected folder.

Delete

This control allows you to delete a selected file from your currently selected folder.

Image Select

You can select a Region of Interest on your Image Tab (live or static) by using the Left-Click Hold and Drag technique. Once selected then you can Copy (Ctrl+C) the selected region and then Paste it into another software program.
You use this command to select the **Whole Video Image Window** (live or static). Once selected, then you can **Copy** (Ctrl+C) the selected region and then **Paste** it into another software program or **File>Paste as New File** to paste image into a new MallincamSky Window.

**Select None**

This command can be used to **De-Select** the image that was selected using either the **Image Select** or the **Select All** commands.

### View

This **Drop-Down Menu** will allow you to **Browse** folders, **Display** or **Remove Tabs** from the **Sidebar**, **Activate Grids** or **Reticules** on the **Video Window**, Change the **Video Window Size** to match your computer real-estate, and Allow you to **move** the image around in your **Video Window**.

**Browse**

The **View>Browse** command from the **View Menu** (or the **Browse Icon** on the **Icon Tool Bar**) is used to browse images under the specified directory in the **Folders Sidebar**.

The **Browse Window** resembles the **Windows Explorer**. **Left-Clicking** on the + will expand a folder so that you can examine its contents.

You can **Right-Click** on a **Folder** (or file) and the actual Windows controls will pop as in **Windows Explorer**.

As you get deeper into the **Browse Window**, you can **Back-Out** or Move Deeper via the **Green Left** or **Right Arrow** in the **Browse Window**.
The **Blue Right Arrow** will take you to your computer’s **Root Directory**.

**Left-Double Clicking** on a **Folder** will open up a **Window Tab** in the **Video Window** (this **Window** will be labeled **Browse**). This **Tab** will display all of the graphic files inside that Folder. If you **Left-Double Click** on a **Graphics File** inside the **Video Window**, it will open up that **Graphics File** in a new **Tab** in the **Video Window**.

You can close the **Browse Tab** in the **Video Window** by **Right-Clicking** on the **Tab’s Title** (**Browse**), then choosing **Close**.

**Sidebar**

The **Sidebar** can contain 3 different **Tabs**: **Camera**, **Folders**, and **Undo/Redo**.

**Left-Click** on the **Sidebar** control to expand it. You will see the 3 choices (each with a **check-mark** beside it), **Left-Click** on the **check-mark** to **Select** or **De-Select** which ones of the 3 you would like to see displayed in the **Sidebar**.

The **Tabs** on the **Sidebar** can remain docked to the **Sidebar** or can be free floating. Just use the **Left-Click Hold and Drag** technique to move the **Tab** to another location on your **Desktop Window**.
To Dock the Floating Tab back to the SideBar, just Left-Double Click on its Name.

**Grids**

The View>Grids control has the ability to display a grid overlay on top of your Video Window. You can use the Auto Grid style of create your own grid format.

Left-Click on the choice you require (No Grids, Auto Grids, or Manual Grids) to activate.
**Auto Grids**

Auto Grids can be set in the View>Grids>Settings control. This command will pop-up the Preferences Window.

Left-Click on the Grids option on the left of the Preferences Window and adjust the Style (No Grid, Auto Grid, and Manual Grid), Line Style (Solid, Dash, Dot, or DashDot), and Color that you are interested in.
Left-Click on the Apply button to display the Grid, then Left-Click on OK to accept.

Manual Grids

Choosing this control will display two small Blue Right Arrow and Down Arrows overlaid on the top of the Vertical Ruler and on the left of the Horizontal Ruler as shown below:

Use the Left-Click Hold and Drag technique to move the Blue Down Arrow along the Horizontal Ruler to where ever you want. When it is dragging over the video/image, there will be a Vertical Line (in the Color and Style chosen by you) aiding you in judging where to release this line on the video/image. You can drag as many lines as you require to overlay them on the video/image.

Similarly, you can drag down as many Vertical Lines as you like to create Vertical Grids.

You can at any time, grab and move the Blue Arrows to adjust the locations of the Horizontal and Vertical Grid Lines.
**No Grids**

The **No Grids** control can be used to temporarily remove the grid overlay from the video/image.

If you re-select **Manual Grids**, your previous designed **Grid Lines** will re-appear.

**Remove All Grids**

This will remove the **Grid Overlay** from your video/image. It will also delete your **Manual Grid Lines** settings (thus allowing you to create a new set of **Manual Grid Lines**).

**Best Fit**

Select the control **View>Best Fit** to automatically resize the image/video to fit inside the **Video Window Tab**.

**Actual Size**

Select the control **View>Actual Size** to reset the **Zoom** to 100% (Actual Size will be disabled if the View is already set to 100%) and place the image/video inside the **Video Window Tab**.

**Full Screen**

Selecting the **View>Full Screen** control will display the video window in full screen mode. You will not see any commands or controls while in this mode.

Pressing the **Esc** key on your keyboard will return MallincamSky to the **Default Video Window**.

**Track**

If the video/image's actual size is larger than the video/image Window, then this control will allow you to position the actual video/image within the video/image Window. This control is activated automatically when necessary.

Its function is similar to the scroll bars. It is an alternative to using the arrows on the scroll bars for positioning the video/image within the window. Position the mouse (make sure to choose a location outside a Region of Interest rectangle. You may need to close the ROI rectangle if necessary) on the actual video/image.
Left-Click and Hold (the Open Hand will change to a Closed Hand). Now drag the image around inside the video/image Window.

If the video/image size is smaller than the video/image Window size, then the track operation will be disabled.

MallincamSky provides three Reticules (or cross-hairs) styles to aid in aligning your telescope to a star (or another stellar object). You can change the color of the reticule via the Option>Preferences control in the Top Menu Line.

Left-Click on Reticule icon to Activate and Left-Click again on Reticule icon to De-Activate.
Browse

This command is used to determine how MallincamSky should display the graphic files when you are viewing the Folders. This command will allow you to change the size of the image icons, determine how to sort the files, add shortcuts to the folders, delete files, refresh the folders, and even determine the properties of the image file all without having to perform these tasks thru the Windows Environment.

Sort

This control allows you the option of rearranging the image files via a variety of choices (Name, Type, size, Width, and Height. All in either Ascending or Descending order.). Just Left-Click on the choice that best suits your needs and MallincamSky will automatically rearrange the files.

Icons

This control allows you to display the Graphic Files as either Large or Small Icons. Simply Left-Click to make your Selection.

Refresh

This control allows you to refresh the contents of the currently selected folder.

Properties

This control will display the current File properties for the Graphics File that you have selected (This is identical to Right Clicking on a File while using Windows Explorer).
Open Record Folder

This control will display the current Video Record Folder (the default Video Record Folder is selected thru the Options->Preference Command).

Open Image Folder

This control will display the current Image Folder (the default Image Folder is chosen by using the Options->Preference Command).

Setup

This Top Menu Line Command is used to provide you information about the SkyRaider AG1.2C Camera activated thru MallincamSky, as well as test the ST4 port on the camera. You can also pause the Video image on the Video Window from here.

Start/Pause

Left-Clicking on this control will Pause the SkyRaider Camera’s live display. Left-Clicking on this control again will activate the live display.

View Properties…

Left-Clicking on this control will pop-up the View Properties Window that contains information about the currently activated SkyRaider AG1.2C Camera.
The SkyRaider AG1.2C series of cameras have a ST4 port, so it can be used to AutoGuide your telescope mount.

This control is used to check if the camera can correctly communicate with the Telescope Mount.

Connect the ST4 cable provided with the SkyRaider AG1.2C Camera to the ST4 Port on your Telescope Mount. Turn on the Telescope Mount to ensure that it is ready to be tested.

Left-Click on this control and the ST4 Popup Window will appear.

The ST4 Window will contain 4 Green Arrow keys that when pressed will send a specific direction command thru the ST4 cable. Press each Green Arrow and note if the Telescope Mount moves in a specific direction.

Due to the various orientations of the SkyRaider Camera once inserted inside the telescope, the Green Directions Arrows will not necessarily match the direction of Mount movement. Don’t worry, all guiding software will automatically orient itself with the movements.

You can abort the movement by Left-Clicking on the Red Stop button in the ST4 Popup Window.

The number box located in the middle of the 4 Green direction Buttons can be increased or decreased to affect the distance the Telescope Mount moves when a Green Direction Button is pressed. You can directly enter a number into the number box, or Left-Click on the up and down arrows to scroll up or down the value in the number box.

Attempt to orientate the SkyRaider Camera in the eye piece holder of the telescope in such a manner as to match the Green Directions Buttons movement of the stars in the video display.
Capture

This **Top Menu Line** command allows you a more in depth capture routine of either a **still image** or a **video stream**. This command will offer connection to **Night Skies Network (NSN)** in future releases.

**Capture Image**

During the **video preview**, you can always choose the **Capture>Image Capture** command to capture the video image. After the image is captured, the captured image (**still image**) will be placed the current active window with an automated title (0001*).

The **Capture>Capture Image** menu now be disabled (as you are now viewing a still image). If you wish to capture another image again, **Left-Click** the active video window (**Video [SkyRaiderAG1.2C]**) title to activate the **Video Window** and the **Capture>Capture Image** menu will be enabled again.

The **Snap Button** on the **Camera SideBar** can continuously shoot the image even if the video window is not activated. **Left-Click** this **Snap** button on the **Camera Sidebar** to a capture image quickly.

Only when the **video** window is active, the **Capture>Capture Image** menu will be enabled. If the **Live** and **Snap** resolutions are different, then **MallincamSky** needs to switch the resolution from **Live** to **Snap** in the background to capture an image with **Snap resolution**. After the **Snap** is finished, then **MallincamSky** will switch back to the **Live resolution** to continue the video stream process. Therefore, it will take more time to capture a still image.

**Auto Capture**

This function can capture a sequence of pictures when using either **Video Mode** or **Trigger Mode**.

First you must set up the location, File Format, Prefix, number of exposures required in the **Options>Preferences Tab** (see **OPTIONS Tab** for more detail).

To start the capturing process, just **Click** on this tab or press the **F7** Function key.

Note: Tab name will change to **Stop Capture**, so **Click** on it to stop the process.

You will see a counter on the bottom left of the screen indicating the capture process i.e. **05/20** (this says taking the 5th image of the required 20).
Start Record…  Start Record…  F9

Note
First you must set up the location, File Format, Prefix, and duration required for the video in the **Options>Preferences Tab** (see **OPTIONS Tab** for more detail).

To start the capturing process, just **Click** on this Tab or press the **F9** Function key.

Note: The Tab name will change to **Stop Capture**, so **Click** on it to stop the process.

Hint
Follow instructions in **User Manual** on using the **Record Button** on **Left Side Panel**, to record video in **Trigger Mode** as this command is identical.

Note
When the Recording process starts, the SkyraideAG1.2C will toggle the fans when recording starts and when the recording sequence stops.

Note
The only way to view Videos (must be saved in **ser** format) using **MallincamSky** is to **Right-Click** on **Video Tab** to **Close** that Video Window, then you will be able open a video using the **File>Open Video** command.

Note
When capturing; the resolution is chosen from the **Capture & Resolution** settings in the left window pane. You will also notice that the **Blue Arrow Record** icon now change to a **Red Stop** icon. Clicking on this Button will stop the capture process.

Hint
Use **Windows Explorer** to View your saved videos.
Batch Record

This command will allow you to save a sequence of video onto your computer. You will need to have already chosen the location, number and duration of the videos in the Option->Preferences… tab.

See Options->Preferences… Tab for more detailed information on setting up the parameters for Batch Record, but below is a quick walk-through

In the Record Tab in Options->Preferences…, choose the location and file type and duration for recorded Video Files

In the Batch Record Tab in Options->Preferences…, chose the number of Videos to be recorded, plus the time interval between each Video.

Once these have been set, all you need to do is Click on the Batch Record Tab (F10) in the Capture Tab.

MallincamSky will automatically start the recording process (notice how the Batch Record Tab has changed (and the Record Button on Main Window turns to a Red STOP symbol), it remains highlighted).

By Clicking on the Batch Record Tab again, MallincamSky will then abort the whole capturing process.
By Clicking on the Red STOP symbol, MallincamSky will only abort the current Video, but will continue with the next sequence.

MallincamSky will also provide you in a status on how the recording are going by displaying a Status Information line on the bottom of its window.

It will provide you the current status of the Recording process.

And the current status of the pause between each Recording.
Image

The Image menu will allow you to adjust the properties or any captured image in an active Image Tab in MallincamSky video/image window.

You can use the SideBar's Undo/Redo Tab to revert any correction back to a previous state.

Mode

The Mode Control will give you the ability Color Quantize, Gray Scale, and Decolorize the selected still image.

The Color Quantize command is widely used to change the image bit. MallincamSky supports the mutual changes among 24 bit, 8 bit, 4 bit or 1 bit images. When the Colour Bits dialog is opened, the default checked color bit is the current image's color bit. Check the desired bit and click OK to end the command. The image will be converted to the selected color bits in the image window.

The Gray Scale command to convert a color image (true color image or index color image) to a gray scale image. If the original image is 24 bit, the new image is 8 bit. Otherwise the bit of the image will not be modified.

The Contrast Preserving Decolorization command to convert a color image (true color image or index color image) to a gray scale image with a unique algorithm to preserved as much of the color contrast for each channel into Monochrome image. If the original image is 24 bit, the new image is 8 bit. Otherwise the bit of the image will not be modified.
The Adjust menu will allow you to adjust the Brightness and Contrast of the image. You will be able to modify the RGB Color balance, as well as the High Lights, MidTones and Shadows values. Color Curves and Filtering algorithms are also in the menu control. You will have the ability to Invert the image as well as perform some Detail Enhancement procedures on the image.

Adjust Brightness/Contrast

The Image>Adjust>Brightness/Contrast command offers simple adjustments to the tonal range of an image. This command makes the same adjustment to every pixel in the image. The Brightness/Contrast command does not work with individual channels and is not recommended for high-end output because it can result in the loss of details about the image.

**Brightness:** Dragging the slider bar to the left decreases the level and dragging it to the right increases the level. The numbers on the right of the slider bar displays the Brightness value. Values can range from -150 to +150. The Default value is 0.

**Contrast:** Dragging the slider bar to the left decreases the level and dragging it to the right increases the level. The numbers on the right of the slider bar displays the Contrast value. Values can range from -150 to +150. The Default value is 0.

Make your adjustments to the Brightness and Contrast values and Left-Click on OK to accept.
Choose the **Image>Adjust>Color•••** command to modify the overall mixture of the colors in an image.

There are **four** color modules that are supported by **MallincamSky**:

**RGB**

**MallincamSky** uses the **RGB** model. It assigns an intensity value to each pixel ranging from 0 (black) to 255 (white) for each of the **RGB** components in a color image.

For example, a bright red color might have an **R** value of 246, a **G** value of 20, and a **B** value of 50. When the values of all three components are equal, the result is a shade of neutral gray. When the value of all components is 255, the result is pure white; when the value is 0, pure black.

**RGB** images use three channels to reproduce up to 16.7 million colors on-screen. In addition to being the default mode for new Mallincam images, the **RGB** mode is used by computer monitors to display colors. This means that when working in color modes other than **RGB**, such as **CMYK**, **MallincamSky** uses **RGB** mode for display on-screen.

Although **RGB** is a standard color mode, the exact range of colors represented can vary, depending on the application or display device.

CMYK

The **CMYK** mode is based on the light-absorbing quality of ink printed on papers. As white light strikes translucent inks, certain visible wavelengths are absorbed while others are reflected back to the eyes.

In theory, pure cyan (C), magenta (M), and yellow (Y) pigments should combine to absorb all light and produce black. For this reason, these colors are called subtractive colors. Because all printing inks contain some impurities, these three inks actually produce a muddy brown and must be combined with black (K) ink to produce a true black. (K is used instead of B to avoid confusion with blue.) Combining these inks to reproduce color is called four-color process printing.

The subtractive (CMY) and additive (RGB) colors are complementary colors. Each pair of subtractive colors creates an additive color, and vice versa.

HSI

Based on the human perception of color, the **HSI** model describes three fundamental characteristics of colors:

- **Hue** is the color reflected from or transmitted through an object. It is measured as a location on the standard color wheel, expressed as a degree between 0° and 360°. In common use, Hue is identified by the name of the color such as red, orange, or green.

- **Saturation**, sometimes called Chroma, is the strength or purity of the color. Saturation represents the amount of gray in proportion to the hue, measured as a percentage from 0% (gray) to 100% (fully saturated). On the standard color wheel, Saturation increases from the center to the edge.

- **Intensity** is the relative lightness or darkness of the color, usually measured as a percentage from 0% (black) to 100% (white).

HLS

The **HLS** model is very similar to the **HSI** color model. The main difference between them is the calculation used to produce the brightness value. In the HLS model, a pixel’s brightness (L) is derived from its three (R, G and B) color values. That is, a pixel’s brightness (L) is determined by the minimum and maximum values of its three-color values.
The values beside the slider bar show the color changes in various color channels.

- The RGB channel values can range from -100 to +100. The Default values are 0.
- The CMYK channel values, they can range from -100 to +100. The Default values are 0.
- In the HSI channel, the H value can range from -180 to 180, the S value can range from -275 to 275, and the I value can range from -442 to 442. The Default value are 0.
- In the HLS channel values, the H value can range from -180 to 180, the L value can range from -100 to 100, and the S value can range from -100 to 100. The Default values are 0.

Select the Image>Adjust>HMS... command to adjust the HL (Highlight), M (Midtone), and S (Shadow) parts of the image.

Each part's value ranges from -100 to 100. This command is only available for 24 bit true color image.

Sometimes you may desire more precise control, or more unusual, nonlinear effects. The Curves tool in MallincamSky provides more arbitrary remapping of the color channels; it is the color-correction tool of choice among many print and photographic professionals.

Using Curves, the input-output mapping of color channels can be defined by an arbitrary cubic spline or can be drawn freehand. This flexibility provides extreme generality.

It is worth the effort to review how color curves work in such graphics programs such as Photoshop (tons of information about curves on the internet).
Filter Color...

Select the **Image>Adjust>Filter Color** command to filter out a special color channel from a color image. Check either **Red**, **Green**, or **Blue** color to filter.

For Example, if **Red** color is checked, then only information about the **Red** channel will be discarded. The **Green** and **Blue** information will remain there.

Extract Color...

Select the **Image>Adjust>Filter Color** command to retain a special color channel from a color image. Check either **Red**, **Green**, or **Blue** color to filter.

For Example, if **Red** color is checked, then only information about the **Red** channel will be retained. The **Green** and **Blue** information will be discarded.

Invert

Select the **Image>Adjust>Invert** command to reverse the pixel values of the active image.

Edge Preserving Smooth

This control looks for the most homogeneous neighborhood area around each point in a picture, and then gives each point the average gray level of the selected neighborhood area. It removes noise in a flat region without blurring sharp edges, nor destroying the details of the boundary of a region. This smoothing also has the ability to sharpen blurred edges.

Choose either a **Recursive** or the **Normalized Convolution**. By adjusting the **Spatial Sigma** (like the domain) and the **Range Sigma**, you can affect how many pixels the algorithm uses when applying the smoothing.
Detail Enhance

This filter works by identifying sharp edge boundaries in the image, such as the edge between a subject and a background of a contrasting color, and increasing the image contrast in the area immediately around the edge. This has the effect of creating subtle bright and dark highlights on either side of any edges in the image, called overshoot and undershoot, leading the edge to look more defined when viewed from a typical viewing distance.

Choose either a Recursive or the Normalized Convolution. By adjusting the Spatial Sigma (like the domain) and the Range Sigma, you can affect how many pixels the algorithm uses when applying the smoothing.

Rotate

This control allows you to rotate and or flip your image across an axis.

Your options include:

- Rotate the image 90 degrees Clockwise (CW)
- Rotate the image 180 degrees Clockwise (CW)
- Rotate the image 270 degrees Clockwise (CW)
- Rotate the image an Arbitrary amount

To Rotate the image a specified amount (in degrees) in a chosen direction (clockwise or counter clockwise). Left-Click on the Arbitrary control. When this option is selected, the Image Rotate Window will popup, where you can enter in the required values. You also have two redrawing algorithm choice for it to use when rotating the image (Bilinear or Bicubic). Bicubic seems to be better for images, but it is your choice that counts.
This control also allows you to flip your image **Horizontally** or **Vertically**.

**Flip Horizontal** reverses the image in the application area so that the top right corner of the original image is now the top left, and the top left corner of the original image is now the top right corner.

**Flip Vertical** reverses the image in the application area so that the top right corner of the original image is now the bottom right corner, and the top left corner of the original image is now the bottom left corner.

Choose the **Image>Crop** command to remove the portions of an image that does not want so that the focus is on the part of the image that is left.

First select **Edit>Image Select** (the mouse cursor will change into cross hairs) from the **Top Menu Line**. Next use the **Left-Click Hold and Drag** technique to draw a rectangle around the portion of the image you would like to keep. Finally select **Image>Crop** and your **image window** will now only contain the portion of the original image that was inside the **Image Select's Rectangle**.

When you create an **Image Select Rectangle**, you can **Left-Click Hold and Drag** the rectangle around your full image to move it to a different location.

You can also resize the **Image Select Rectangle** by grabbing one of the little boxes around the rectangle and dragging the mouse to increase, decrease, or change dimensions of the rectangle.
Select the **Image > Scale ...** command to change the image to a specified size. This process actually changes spatial resolution by adding (replicating) or removing (decimating) pixels to achieve the specified dimensions.

**Width and Height:** When choosing the **Image Scale** command; the dialog box displays the dimensions of the original image in pixels. The **Width** and the **Height** can be set on the new image by adding or removing pixels. If **Constrain Proportions** is checked, the **Width** and **Height** will stay proportionate to each other. If the **Constrain Proportions** is unchecked, the **Width** and the **Height** can be set independently, but this will distort the image.

**Reset:** Resets the image’s **Width** and **Height** to the original settings.

**Constrain Proportions:** To maintain the current proportions of pixel **Width** and **Height**, check **Constrain Proportions**. This option automatically updates the **Width** as the **Height** is modified, and vice versa. Otherwise, uncheck the **Constrain Proportions** button.

**Scale method:** There are 2 options for the algorithm that the **Scale method** uses to resize the image. They are: **Bilinear**, and **Bicubic**. The default scaling method is **Bilinear**.

Once you have selected your parameters, **Left-Click** on **OK** to make the new **Image Scale** final.
A **Histogram** illustrates how pixels in an image are distributed by graphing the number of pixels at each color intensity level. The **Histogram** shows detail in the shadows (shown in the left part of the histogram), mid-tones (shown in the middle), and highlights (shown in the right part).

A **Histogram** can help you determine whether an image has enough detail to make a good correction.

A histogram is a mathematical graph that shows you the current **tonal range** of an image. This way you can evaluate it and, if necessary, correct it.

**Tonal range** refers to the range of brightness levels in the image. A histogram shows us how much of the image is currently pure black, how much is currently pure white, and how much of it falls somewhere in between.

It is very important to note that even though we’re talking about brightness levels, we’re not just talking about black and white (grayscale) images, but Histograms work equally well, and are just as important, with full color images.

This is because, even though we don’t always think of color as being anything but color; yet every color in your image has its own brightness level.

Orange, for example, are typically very light; while blues and reds are much darker. These differences in brightness values mean that color can have a huge impact on the tonal range of your image.

Do a Google Search on **How to Read and Understand Image Histograms in Photoshop** to find out more information on how to use Histograms to improve your images.

Choose the **Image>Histogram...** command to open the **Histogram Window**. Depending on the image’s color mode, choose R, G and B, or **Luminosity** to view a composite Histogram of all the channels.

If the image is **RGB true color**, choose **Luminosity** to display a Histogram representing the luminance or intensity values of the composite channel.
If the image is **RGB true color**, choose **R**, **G** and **B** to display a composite Histogram of the individual color channels in color.

Do one of the following:

- To view information about a specific pixel value, **place the mouse pointer in the Histogram.**
- To view information about a range of values, click down **the Left-Click hold and Drag** the mouse into the Histogram to **highlight the range.**

The Histogram Window displays the following statistical information below the Histogram:

- **Pixels:** Represents the total number of pixels used to calculate the Histogram.
- **Level:** Displays the intensity level of the area underneath the pointer.
- **Count:** Shows the total number of pixels corresponding to the intensity level underneath the pointer.
- **Percentile:** Displays the cumulative number of pixels at or below the level underneath the pointer. This value is expressed as a percentage of all of the pixels in the image, from 0% at the far left to 100% at the far right.

The Histogram from **Image>Histogram** (still images) provides different information about the video/image window than the **Sidebar’s Histogram** (live video capture).
Process

MallincamSky provides some very advance image processing tools. You can apply these tools to your image to tweak the final output. It would take a novel to explain each of these standard graphical enhancement tools. So, I will leave it up to you to Google Search the enhancement type to see if it is something you could use.

You can use the **SideBar’s Undo/Redo Tab** to revert any correction back to a previous state.

**Hint**

You can find **Enhancement Filters** inside the **Process** command to sharpen your image.

**Stitch:** See Stitch section later in the manual
You can modify the color effectiveness range with the **Range** control to color sharpen your image.

You can modify the image the **pixel/no pixel** count with the **Binary** control.
You can examine the image as a 3-D color contour map with the **3-D setup** control.

You can apply the **Pseudo Color** application tools to turn a Black and White image into color tones.
Image Stacking

Image Stacking control will allow you to select a saved video file, then it will do an elementary stacking process on the file.

In the Image Stacking process, MallincamSky takes the first frame as the reference image, this means the first frame is very important and should be assure the first frame to be the right image scene and the subsequent frames have a greater overlap region with the first frame.

The stacked image signal to noise ratio is greatly improved. The stacked image may have had some black edges, this is because the images in the video has moved and in the stacking process, MallincamSky will added black to the image area that has no corresponding pixel in the reference image.

This Image Stacking process will not align the video images, so may be better suited for Deep Sky than for planets.

Left-Click on the control and MallincamSky will open up a Dialog Window.

![Open Dialog Window](image)

Using the Open Dialog Window move to the directory and Left-Click on the File you would like to apply the Stacking process to, then Left-Click on Open.

MallincamSky supports the following video formats for the Image Stacking process: wmv, asf, avi, mp4, m4v, 3gp, 3g2, 3gp2, 3gpp, mov, mkv, flv, rm, and rmvb.
MallincamSky will Open an Image Stacking Progress Bar to inform you of the process.

Once completed, the stacked image will appear in the Video/Image window. You can now apply other processing techniques to this image which has a large signal to noise ratio.
Options

The Options Menu provides 7 Tabs in the Preference Window. They are: Record, Batch record, Auto Capture, File, Grids, Video, and Misc.

The Options/Preference/Record tab will allow you to set the location, File Format, File Prefix, File Type, duration or Frame Limit for the Video recording of the current SkyRaider camera.

Directories:

The file Directory can be select by Left- Clicking the Browse button (…).

File:

The File Name: This can be a combination of Name of Format, File Prefix, and File Type (avi or ser format) as shown in the Sample.

Limit:

You can either choose capture a specific number of seconds (from 0 seconds to 36,000 seconds) or a specific number of frames (from 1 frame to 1,000,000 frames). Just Check the box under limit and enter the required amount. If none is checked, MallincamSky will record until you Stop the recording by Clicking on the Red Stop Recording button on the Left of the Screen.
The **Options->Preferences…->Batch Record** tab will allow you to set the number of Video recordings in the batch, plus the time interval between each separate recording.

Clicking on **OK** accepts the settings.

The **Options->Preferences…->Auto Capture** tab will allow you to set the location, file format, type, interval and number or required images for the **Auto Capture (F7)** function of MallincamSky.
**Directory:**

The file **Directory** can be select by **Left- Clicking** the **Browse** button (...). You can also set a subfolder as a specific name such as the **Target** name.

**File:**

The **File Name**: This can be a combination of **Name of Format**, **File Prefix**, and **File Type** as shown in the Sample. The **File Type** can be **bmp**, **png**, **jpg**, **tiff** or **fits**.

**Capture every frame:**

You can either choose capture every frame or select a Time slot. If Capture every frame is chosen, then MallincamSky will capture the number of images indicated by the **Total Images** count (**do not leave unchecked**).

**Time Slot:**

This **Time slot** (in **Seconds** from **2s** to **3600s**) is the time that MallincamSky waits before capturing another image (**5s** would indicate waiting another **5** seconds before capturing another image).

**Total Images:**

Checking **Total Images** will enable its edit box. You can enter the **Total Images** (from **1** to **9999**) to be captured. MallincamSky will stop the **Time-lapse capture** process automatically when the **Total Images** are reached.

If **Total Images** is **unchecked**, MallincamSky will capture the images continuously until you choose the **Capture>Stop Auto capture** command again to stop the **Time-Lapse capture**.

**Left-Click OK** to begin the Time-lapse capture, or **Cancel** to cancel the **Start Time-Lapse (Auto Capture)*** command.

**Clicking on the OK Button** accepts the capturing settings. To active the Capturing process use **Capture->Auto Capture (F7)**.

After the Time-lapse capture is started, the **Capture>Start Auto Capture*** menu will be changed to the **Capture>Stop Auto capture** menu. Choosing this command will stop the Time-lapse capture.

There are a variety of image formats available (they are **bmp**, **jpg**, **png**, and **tif**) to save the captured image. For example, when choosing the **jpg** format, you can set the parameters of **Option** to adjust its compression quality or encoding method. Please check the **File>Save As*** menu for more details.
One can check a **File Extension** for the specified file Format and its Abbr. (abbreviation), to determine whether or not it will be displayed in the **Browse** window or not (The checked Format can be displayed in the Browse window).

The Target Tab allows you to label the target that you are currently shooting. The 10 solar system objects are set as the defaults, but you may change the names of the objects, add new objects, export or import list from others from this Tab.

The target list appears in the drop down list available on the **Top Line** icons.
The **Grids** Tab allows you to determine if you would like a **Grid** displayed, and if so how should it be drawn. Grids can also be used to define the color of the **Reticule** that can be drawn over the image.

**Grid Style:** The Grid Style can be **No Grid**, **Auto Grid** or **Manual Grid**. Default is **No Grid**.

**Grid Line Style:** The Line Style for the grid can be Solid, Dash, Dot or DashDot. The Default is Solid.

**Grid Line Color:** The color of the grid line. The Default color is Red (255,0, 0).

**Reticule Color:** The color of the **Reticule**. The Default color is Red (255,0, 0).

You can overlay the **Date and Time** on the **Video Window** (With a location and color of your choice). You can also have **MallincamSky** display the **Clarity Factor** (can assist in focusing) on the image. These overlays are updated in Real-time.

**For Example:**

The settings on the Right will overlay the video stream with

Will produce the overlay in the top left corner.
The Misc page is mainly used for the control of the MallincamSky’s User Interface. It mainly includes:

1. MallincamSky’s special file format warning information.
2. Sidebars.
3. User Interface Style;
4. Language.
5. Graphics accelerator
6. Privacy.

Just Left-Click in a checkbox to choose your required Option.

**Window**

The menu control will close all open windows (Tabs), and can reset the lays back to its default settings.

Selecting the Closes All command will close all of the pictures opened or captured inside MallincamSky’s frame. If you have made any modifications to the pictures or if you have captured some pictures from the camera, choosing the Close All will let you finish the saving operations quickly.
The Close All will actually close down the live Video Stream window. You can now use the File>Open Video to view a saved video. Left-Click on camera will again open the Video Stream window.

**Reset Window Layout**

Choosing this command will `reset` the MallincamSky window layout to the original one. The reset will be effective after restart.

**Windows...**

Choosing the Windows>Windows••• control will open a dialog box that lets you manage the currently opened windows.

The dialog allows you to manage large lists of open windows by assigning them into groups. Let us say you have eight windows open, but want to close four of them scattered through the list.

1. Choose the Windows>Windows••• control.
2. Select the windows you want to close. Hold Ctrl or Shift key to select more than one at a time. Here, 4 windows are selected.
3. Click Close Window(s) button, those four selected windows will be closed, leaving the other files or captures available for editing.

You can use this command to switch to a required window on a list by hitting Activate.
About

This control will pop-up a window that informs you of the version number, and built date of this version of MallincamSky.

Left-Click on OK to Close.
Open

The **Open Image** command is used to open an existing image file. This command can also be used to preview an image in small size, or to view its statistics and information without actually opening the image itself. You can use this command to quickly locate a particular image. **MallincamSky** supports and can open a variety of image formats. These are identified in the **Files of type** list box.

**MallincamSky** can open more than one image simultaneously by:

- **Ctrl + Left Mouse Click** on each required file then **Left-Click** on Open
- **Shift + Left Mouse Click** method to highlight the files to be opened, then **Left-Click** on Open

When an image is opened, **MallincamSky** places it into a new image window. It then becomes the active image.

**Note**

**MallincamSky** maintains, at the **File>Recent Files** submenu, a list of the last opened files.
Save

The **Save Icon** allows you to save an image onto your computer. The command immediately stores the current window image to its file (the filename is listed on the window's title bar) while leaving the image still active in its window.

If the image is untitled or titled with a digit, **MallincamSky** will issue the **File>Save As** dialog automatically. The default "**Save as type**" will be "Window Bitmap (*.bmp, *.dib, *.rle)".

The **Save Icon** can be used to save the most recent changes to disk. It is often performed as a precautionary measure during lengthy or involved processes to reduce the amount of reprocessing that might be required in the event of a system failure or operational error.

When an image is closed and not to save its changes is chosen, **MallincamSky** discards all changes made since the last **Save** operation.

The **Save Icon** always saves the contents of the entire window, even if there is an **AOI** (Area of Interest) defined on it;

The **Save Icon** can be used to save a **Snap Shot** to the default File folder of an active **Video Stream** (it will ask you for a **File Name**).

Browse

The **Browse Icon** from the **MallincamSky Tool Bar** is used to browse images under the specified directory in the **Folders Sidebar**.

This command is identical to hitting the **Folder's Tab** at the bottom of the screen.

To return back to the **Camera Bar**, just **Click** on the **Camera Tab** located at the bottom of the screen.

The **Browse Window** resembles the **Windows Explorer**. **Left-Clicking** on the + will expand a folder so that you can examine its contents.

You can **Right-Click** on a **Folder** (or file) and the actual Windows controls will pop as in **Windows Explorer**.
As you get deeper into the **Browse Window**, you can **Back-Out** or Move Deeper into the File Folders via the **Green Left** or **Right Arrow** in the **Browse Window**.

The **Blue Right Arrow** will take you to your computer’s **Root Directory**.

**Left-Double Clicking** on a **Folder** will open up a **Window Tab** in the **Video Window** (this **Window** will be labeled **Browse**). This **Tab** will display all of the graphic files inside that Folder. If you **Left-Double Click** on a **Graphics File** inside the **Video Window**, it will open up that **Graphics File** in a new **Tab** in the **Video Window**.

![Image of Browse Window](image)

You can close the **Tab** in the **Video Window** by **Right-Clicking** on the **Tab’s Title** (**Browse**), then choosing **Close**.

![Image of Close Tab](image)

**Target**

This icon allows you to give a name to the current Target that you are imaging. You can add or change names in the **Options->Preferences…->Target** Tab. The Target name can automatically be used as a **suffix** for a file folder name when saving images or video captures.

![Image of Target Options](image)
Auto Capture

This icon activates the Auto Capture routine in MallincamSky.

You must have previously chosen the File location, File Type, /Number of required images, and the Time Interval between each captured image from the Options->Preferences...-> Auto Capture Tab (see Options for more information).

The Auto Capture Icon will remain highlighted until the capture process is completed. You can Abort the capture process at any time by again Clicking on the Auto Capture icon.

MallincamSky will indicate the status of the Auto Capture process on the lower left of the MallincamSky window.

Batch Record

This icon activates the Batch Record routine in MallincamSky.

You must have previously chosen the File location, File Type, /Number of required Videos, and the Time Interval between each captured video from the Options->Preferences...-> Batch Record Tab (see Options for more information).

The Batch Record Icon will remain highlighted until the capture process is completed. You can Abort the capture process at any time by again Clicking on the Batch Record icon.

MallincamSky will indicate the status of the Batch Record process on the lower left of the MallincamSky window.

Pause Video Capture

This icon Pauses the Batch Record routine in MallincamSky. It will highlight when you are able to pause a video capture.

Pause Video Capture

This icon will allow you to open up and view either the default Record or the default Image folder. This way you can examine the results of the recording.
**Zoom**

The Zoom Icon allows you to Zoom-In or Zoom-Out while viewing a Video/image window. The Drop-Down list will offer you the zoom options. Just highlight the zoom option with your mouse and release the mouse button.

You can change the **Zoom** by rolling your **Mouse Wheel**, if your mouse has one.

**Hint**

You can select a **Region of Interest** on your **Image Tab** (live or static) by using the **Left-Click Hold and Drag** technique. Once selected then you can **Copy** (**Ctrl+C**) the selected region and then **Paste** it into another software program.

Once a **Region of Interest Rectangle** is on the screen, you can **drag** it around, or grab one of its handles and **resize** it.

**Note**

**Left-Clicking** on the **Image Select Icon** again will remove the Region of Interest Rectangle from the screen.

**Track**

If the **video/image's** actual size is larger than the **video/image Window**, then this control will allow you to position the actual **video/image** within in the **video/image Window**. This control is activated automatically when necessary.

Its function is similar to the scroll bars. It is an alternative to using the arrows on the scroll bars for positioning the **video/image** within the window. Position the mouse (make sure to choose a location outside a **Region of Interest** rectangle. You may need to close the **ROI** rectangle if necessary) on the actual **video/image**.

**Left-Click and Hold** (the **Open Hand** will change to a **Closed Hand**). Now drag the image around inside the **video/image Window**

If the **video/image size** is smaller than the **video/image Window size**, then the track operation will be disabled.
**Histogram**

This icon will display a real-time Histogram (for information purposes) beneath the Video window being displayed. Clicking on the icon again will remove the Histogram.

The icon has a pull-down tab where you can choose to display the real-time Histogram in either a Linear or a Logarithmic scale. Clicking beside the scale name will immediately make the change in the Histogram.

![Histogram Icon]

**Reticule**

MallincamSky provides three Reticules (or cross-hairs) to aid in aligning your telescope to a star (or another stellar object), plus a Reticule centering icon.

Left-Click on a Reticule Icon to activate it and Left-Click again to De-Activate.

You can change the color of the reticule via the Option>Preferences control in the Top Menu Line.

![Reticule Icon]

You can Left-Click-Hold and Drag the Center of the cross-hair to any location on the screen. To return the intersection of the cross-hairs to the center of your video window, just Click on the Reticule Centering Icon.
If your SkyRaider camera (such as the SkyRaiderAC1.2C) has a ST4 port, then it can be used to AutoGuide your telescope mount.

This control is used to check if the camera can correctly communicate with the Telescope Mount.

Connect the ST4 cable provided with the SkyRaider Camera to the ST4 Port on your Telescope Mount. Turn on the Telescope Mount to ensure that it is ready to be tested.

Left-Click on this control and the ST4 Popup Window will appear.

The ST4 Window will contain 4 Green Arrow keys that when pressed will send a specific direction command thru the ST4 cable. Press each Green Arrow and note if the Telescope Mount moves in a specific direction.

Due to the various orientations of the SkyRaider Camera once inserted inside the telescope, the Green Directions Arrows will not necessarily match the direction of Mount movement. Don’t worry; all guiding software will automatically orient itself with the movements.

You can abort the movement by Left-Clicking on the Red Stop button in the ST4 Popup Window.

The number box located in the middle of the 4 Green direction Buttons can be increase or decrease to affect the distance the Telescope Mount moves when a Green Direction Button is pressed. You can directly enter a number into the number box, or Left-Click on the up and down arrows to scroll up or down the value in the number box.
Attempt to orientate the SkyRaider Camera in the eye piece holder of the telescope in such a manner as to match the Green Directions Buttons movement of the stars in the video display.

**ST4 Test**

These icons allow you to advance or reverse the current frame when viewing a Video in the ser format.

Recall: to load a video for examination and viewing first close down the live camera window (this stops the camera). Then choose File->Open Video and select the ser format video to view. The icons will now become active. You can now restart the Mallincam camera if required.

**Stitch**

When the Video Window is active, choosing the Stitch Icon will invoke the video Stitch dialog window as below:

The purpose on this control is to stitch (glue) together images to create a panoramic view (image) so plan ahead with this control; are you going to create a horizontal panoramic image, or a vertical panoramic image.

- Have the camera viewing a specific location (or object). Now Left-Click on the Snap button. This will place a snapshot in the viewing box.
➢ Move the telescope so that you have some overlap in the image, and **Left-Click** on the **Snap** button again.

➢ Repeat as needed.

➢ When you are completed taking the snaps, **Left-Click** on **Next** to bring up the next **Stich Window**.

![Stitch Window](image)

➢ Examine the options in this window and make the appropriate decisions on how you would like **MallincamSky** to Stich the snapped images together (this is where the pre-planning comes in handy). You will still be experimenting with your decisions.

**Panorama Straighten:** The image stitching direction can be **Horizontal**, **Vertical**, or **None**.

**Projection Type:** For image pieces that have been taken from the same location, stitched images can be arranged using one of following projection mappings: **Plane**, **Cylindrical**, **Spherical**, **Fisheye**, **Stereographic**, **Mercator** or **Transverse Mercator**.
Seam Finder: MallincamSky provides four Seam Finding algorithms: None, Voronoi Diagram, Graph Cut Color, or Graph Cut Color Grad.

Exposure Compensation: This is used to minimize the exposure differences between the stitched images. Compensation algorithms available are: None, Gain, and Blocks Gain.

Bundle Adjust: This is the process of simultaneously refining the 3D coordinates that describe the geometry in accounting for the relative motion of the images. Two algorithms are available: Ray Adjust and Reprojection Error.

- Once completed, Left-Click on Next to bring up the final Stitch Window.

- Again make some logical guesses with the numbers, and Left-Click on the Finish button when decisions have been made.
MallincamSky will work thru the Snaps (and apply the choices you have made) and will place the final result in an image window for your viewing pleasure.

You can try other Stitching decision by having the Stitched imaged active in your Video Window and Left Clicking on the Stitch Icon again. You will notice that your original snapped image is available for you to play with and combine in other ways.
Preferences

This icon opens up the preferences window. This icon is identical to the Main Tab line Options->Preferences… . See above in the Options Tab.
6. Controlling the SkyRaider

Once you have a connection to the SkyRaider Camera, your next task will be to adjust the controls that make it possible to improve the image the SkyRaider is capturing. These controls are located on the Left SideBar Menu on MallincamSky.

The Controls all have drop-down arrows; Left-Clicking on the Down-Arrow in the control heading will expand that control. Some controls will also display a coloured rectangular box on the Video Window to remind you that that control is in effect. You will be able to collapse the control window by Left-Clicking on the Up-Arrow on the control heading.

Camera List

The Camera List control lists the current SkyRaider cameras connected to the computer. Left-Clicking on the camera name will start the camera video window. You will see a tabbed frame (with SkyRaider Camera Name) appear in the window after selecting the Camera from the list. If you are only using the SkyRaider AG1.2C, then this is what you should see. Just Left-Click on SkyRaiderAG1.2C to activate the camera. You will see a Window open in the Video Window.

You can only access one SkyRaider Camera at a time.
Capture and Resolution

The **Capture and Resolution Tab** allows you to adjust the resolution (the current SkyRaider AG1.2C has a fixed resolution), modify the **Gain**, and choose the type of **Exposure Mode** that you require for the camera.

**Resolution**

Located at the top of this control is the **Resolution Command**. This command allows you to adjust both the display and capture resolution of the **SkyRaider Camera** (each model of the SkyRaider Camera will have its own resolution settings that will appear in the list). Once the resolution is set, this control will also allow you to either take a snap shot of the image, or save a video recording of what is currently being displayed.

**Left-Click** on the **Drop-Down list on the Resolution:** to see all the allowable resolutions available for your **SkyRaider**. The **Skyraider AG1.2C** has two resolutions: 1280 x 960 and 640 x 480.

**Snap**

**Left-Clicking** on **Snap** will tell MallincamSky to display in a **New Tabbed Window** containing a snap shot of the image that is currently being exposed by **SkyRaider Camera**. The image will appear in the **Video Display Window**, with a name which follows the naming convention `nnnn*` (for example 0001*).

Every time you **Left-Click** on **Snap**, another **tabbed window** with the name number increased will appear in the Window. The image is **only displayed** in the **Video Window**; it is **not saved** on your computer.

You can save the image (and thus rename it), by using the **Save icon**, or **File>Save As...** command from the **Top Menu Line**.
Record

This command is only available when the Mallincam SkyRaider is in Video Mode. See the Top Line Capture Tab for details on how to record video when in Trigger Mode.

Prior to pressing this icon, you must use the Options->Preferences… Tab to choose the location, name, format, and duration of the video.

Left-clicking on the Record Icon will tell MallincamSky to start recording a video of what is currently being captured by the SkyRaider (you will now be able to see the image being recorded as the Record Button will activate the camera).

When the Mallincam SkyRaider is recording, the Icon will change to a Red STOP Symbol. By Clicking on the Stop Icon, MallincamSky will terminate the Video recording process.
**Gain**

This control allows you to adjust the gain. **Gain** will brighten up the image (but it can also brighten up the artifacts). The higher the **Gain** value; the shorter the exposure that you will require. All you need to do is find the highest **Gain** value that provides you with the image you are satisfied with.

The **Gain Control Bar** has an indicator to provide you with the current Gain setting on the camera. Gain ranges from a low of 1 to a high of 50.

You can modify the **Gain** in two different ways:

- By **Left-Click-Hold and Drag** the marker bar to the required value.
- If you **Left-Click** on the **Slider Bar** (which selects it), you can use the **Left** and **Right Arrow Keys** of your keyboard to move the slider (this gives you more control).

For **Deep Sky Objects**, start the Gain at about 50. For **Planetary Objects**, start the Gain at about 5.

**Exposures**

The Mallincam **SkyRaider AG1.2C** camera provides two different types of exposures. **Video Mode**, where exposures up to 5 seconds are taken, and **Trigger Mode** were exposures from 25us to 16 minutes and 40 seconds can be taken.

**Video Mode**

This control allows the **SkyRaider AG1.2C** to have an exposure up to 5 seconds (5000ms), this mode is ideal for focusing the telescope and imaging planetary objects. You can have MallincamSky automatically choose the exposure by checking Auto Exposure check box, or you can set an exposure time yourself.

**Video Mode** is activated by **Left-Clicking** the **Video Mode Radial Button**.
Exposure Target

MallincamSky uses the image contained in the **Green Rectangle** to aid in determining the best method to match the Exposure target. To use **Exposure Target**, **Auto Exposure** must be checked. You can change the Exposure Target by **Left-Click-Hold and Drag** the marker bar to the required value. If you **Left-Click** on the **Slider Bar** (which selects it), you can use the **left** and **right** arrow keys of your keyboard to move the slider (this gives you more control).

When **Video Mode** and Auto Exposure is selected, you will see a **Green Rectangle** (labelled **Exposure**) will appear over your **Video Window**. This **Green Rectangle** is a marked region that is a reference region for judging if the image brightness has reached the **Exposure Target Value** (When **Auto Exposure** is selected). Dragging or Resizing the **Green Exposure Rectangle** to a dark area will increase the video brightness and Dragging it or Resizing it to a bright area will decrease the video brightness.

The **Green Exposure Rectangle** will be removed when auto-exposure in unchecked.
**Exposure Time**

The current Exposure time is displayed above the Exposure Time slider. MallincamSky will display the exposure time in ms, from 0 ms to 5000 ms.

To use Exposure Time, Auto Exposure must be unchecked. You can modify the Exposure Time in three different ways:

- By **Left-Click-Hold and Drag** the marker bar to the required value.
- If you **Left-Click** on the Slider Bar (which selects it), you can use the **Left** and **Right Arrow Keys** of your keyboard to move the slider (this gives you more control).
- If you **Left-Click** on the **Current Exposure Time Value**, a window will open up where you can enter in the exact exposure time you require. This window will also provide you the exposure limits the SkyRaider Camera can handle.

Don’t forget to **Left-Click** on **OK** to have MallincamSky accept the entered exposure time.

For any exposure **over 5 seconds**, you can determine how long your camera’s exposure time has left by looking at the lower right hand corner of the MallincamSky’s Window. It will indicate to you the current time remaining of the exposure time that you had previously set.

The SkyRaider AG1.2C will use the following format to inform you of the current exposure condition: **Time Left/Exposure Time**

The example on the left is telling us that we have 2 seconds remaining on our 5 second exposure.
If you have enabled the **Dark Field Corrections** for this session (**Dark Fields** are stored directly in the **SkyRaider Camera** and will be deleted when the camera is turned off), the **SkyRaider** will automatically apply the best **Dark Field Correction** to your image when **Dark Field Correction** is enabled.

### Trigger Mode

**Trigger Mode** is used mainly for exposures over 5 seconds (Deep Sky Objects). It is selected by checking the **Trigger Mode Radial Button**. This mode does not require the Green Rectangle for exposure control. But rather allows you to take a **Single** image, or continuously **Loop** images from the **SkyRaider AG1.2C**.

- You have two methods of setting your exposure to a large value:
  - You can **Click** in the **Time Unit Box** of choice and enter in an amount (i.e. **30 seconds**) using your Keyboard.
  - You can **Click** on the **up** or **down** arrow in the **Time Unit Box** of choice to move the exposure time to your required value (**30 seconds**).

- **Click** on the **Single Button** to take a single exposure to see if the image of the object is close to the brightness you need.

- If you are satisfied with the single image, then **Click** on the **Loop Button** to have the SkyRaider AG1.2C continuously take images at the entered exposure value (it will change its name to **Stop**, so you can again **Click** on the button to stop the Looping).

To capture a sequence of images using the Mallincam **SkyRaider AG1.2C**, there is a series of command controls available for you.
Options

Clicking on this Button opens up the Sequence Options Window.

This Window allows you to either display the sequence of automatic captures in a window on MallincamSky (not recommended… too many windows), or Save the sequence images to a file. You have complete control, since you can choose specific directory, a File Prefix, a numbering system, and even a file format to match your preferences (this is great for choosing a folder location for AstroToaster).

Number in Sequence

Use this control to enter in the number of images you would like MallincamSky to save to your selected folder (from the Options Command above).

You will see the status of the Frame sequence by a counter located on the bottom of the Video window.

Sequence

Clicking on the Sequence Button will start the sequence capturing process. Once Sequencing, the Sequence Button’s name will change to Stop. Clicking on the Stop Button will abort the sequence process.

The camera cannot be Looping at the time you Click on the Sequence Button.
Bit Depth

Pixel Bit Depth relates the number of bits assigned to produce a color (or shade of Gray). The larger the number of bits, the larger the number of assigned colors (or shades of Gray) that the camera can produce.

In an 8 bit image; for each color channel (Red, Green, Blue), there are 8 bits assigned. That is, there are $256 \ (2^8)$ shades of Red, Green, and Blue available.

In a 12 bit image; for each color channel (Red, Green, Blue), there are 12 bits assigned. That is, there are $4096 \ (2^{12})$ shades of Red, Green, and Blue available.

The larger the Bit Depth, the larger the data, and the harder the CPU must work to produce image adjustments.

Color Balance

The Color Balance control allows you to manually adjust the individual Red, Green, and Blue components of your image to better match your requirements.

To adjust each specific colour use the Left-Click-Hold and Drag mouse technique.

Once this control is expanded, MallincamSky will draw a Red Region of Interest Rectangle on your Video Window. You can adjust the size and location of this rectangle by using Left-Click-Hold and Drag mouse techniques.
**White Balance**

Drag or Resize the Red Rectangle to a pure white area and Left-Click on the White Balance Button to establish the video White Balance for future video streaming process.

To adjust the Red, Green, or Blue components of Color Balance use the Left-Click-Hold and Drag technique to move the sliders., or Left-Click on a slider (to activate it), then use your Left and Right Keys on your Keyboard to move the sliders.

If you (or the SkyRaider Camera) ever get confused with what settings you have entered into the Color Balance control, you can reset these values back to their defaults by Left-Clicking on the Default Button.

**Color Adjustment**

The Color Adjustment control will allow you to adjust: The Hue, The Saturation, The Brightness, The Contrast, and the Gamma of the object that the SkyRaider AG1.2C is exposing.

Any changes to these commands will only be display after the next camera refresh. (which for Deep Sky Objects can take a while, depending upon the exposure).

It is recommended as you become comfortable with these settings, you will determine what values are the best starting point so record them so you can quickly get these values to a setting that works for you.
**Hue**

This command controls the **Hue** of the Video image. **Hue** is one of the main properties of color. By adjusting **Hue**, you are changing the balance of **Red**, **Green**, and **Blue** in the image.

You can either use the **Left-Click-Hold and Drag** technique to move the slider to the left or right, or just **Left-Click** on the **Hue’s** slider (this selects it), then use your **Left** and **Right** arrow keys on your Keyboard to adjust the value (small **Hue** adjustments are easier with this technique). The value of the **Hue** setting will be displayed above the slider.

**Saturation**

This command controls the **Saturation** of the Video image. **Saturation** increases the separation of colors on a video image. It has the ability to enhance or inhibit the colors on the video image.

You can either use the **Left-Click-Hold and Drag** technique to move the slider to the left or right, or just **Left-Click** on the **Saturation’s** slider (this selects it), then use your **Left** and **Right** arrow keys on your Keyboard to adjust the value (small **Saturation** adjustments are easier with this technique). The value of the **Saturation** setting will be displayed above the slider.

**Brightness**

This command controls the **Brightness** of the Video image. **Brightness** makes the video image brighter or dimmer. This is a linear adjustment.

You can either use the **Left-Click-Hold and Drag** technique to move the slider to the left or right, or just **Left-Click** on the **Brightness’s** slider (this selects it), then use your **Left** and **Right** arrow keys on your Keyboard to adjust the value (small **Brightness** adjustments are easier with this technique). The value of the **Brightness** setting will be displayed above the slider.

**Contrast**

This command controls the **Contrast** of the Video image. **Contrast** is defined as the separation between the brightest and darkest areas on the video image.
When you adjust the **Contrast**, you increase the separation between bright and dark.

You can either use the **Left-Click-Hold and Drag** technique to move the slider to the left or right, or just **Left-Click** on the **Contrast**’s slider (this selects it), then use your **Left** and **Right** arrow keys on your Keyboard to adjust the value (small Contrast adjustments are easier with this technique). The value of the **Contrast** setting will be displayed above the slider.

![Contrast Slider]

This command controls the **Gamma** of the Video image. **Gamma** adjusts the mid-tones in a non-linear manner. That is, rather than make the image look brighter; it can increase the brightness of the shadows and mid-tones, without affecting the highlights in the image (This control is like adjusting the mid-tone slider on a histogram).

You can either use the **Left-Click-Hold and Drag** technique to move the slider to the left or right, or just **Left-Click** on the **Gamma**’s slider (this selects it), then use your **Left** and **Right** arrow keys on your Keyboard to adjust the value (small Gamma adjustments are easier with this technique). The value of the **Gamma** setting will be displayed above the slider.

![Gamma Slider]

If you (or the **SkyRaider Camera**) ever get confused with what settings you have entered into the **Color Adjustment** control, you can reset these values back to their defaults by **Left-Clicking** on the **Default Button**.

![Default Button]

**Frame Rate**

The speed of the through-put on the USB 2.0 port on your computer can depend on many parameters that are specific to the processes running on your computer. This through-put can be affected by the current Windows environment, CPU, graphics cards.

Using the **Left-Click-Hold and Drag** technique, move the slider to the highest frame rate that your computer can support.

![Frame Rate Slider]
Start with the **Frame Rate** slider at the highest value, and only adjust lower if video image fails to appear. *Most* will find setting frame Rate towards the **Low** end of the scale better.

### Color/Gray

This control contains commands allow the SkyRaider AG1.2C to display its displayed images I color (these colors can be adjusted using the commands seen above) or display the image in shades of grey. Some uses prefer the subtle contrast variations that a grey image provides, especially when imaging the Moon.

If you require the color video to be displayed in **Color**, then **Left-Click** on the **Color** choice.

If you require the color video to be displayed in shades of **Gray**, the **Left-Click** on the **Gray** choice.

### Flip

This control allows you to **Flip** the video image, **Horizontally**, **Vertically**, or **Both**. This is a useful command, as it allows you to match the image orientation to that of the orientation of the actual object (which changes with the number of reflecting mirrors in your telescope).

**Left-Click** to place a **check mark** in the **Horizontal**, **Vertical** boxes to have the image immediately reflect your choices.
**Sampling**

This control contains commands that are only enabled on those SkyRaider Cameras that support binning.

If you require to **Bin** or **Skip** your video sampling rate from the SkyRaider Camera, then this control allows you to select and/or change the current setting.

**Bin** refers to the method of combining (averaging) pixels of block of neighboring same color pixels to resize the video to a lower resolution (can increase video frames/second).

**Skip** (also known as decimation) means that a certain amount of pixels is not read out but skipped (horizontally, vertically or in both axes). This reduces resolution of the resulting video but introduces subsampling artifacts.

Left-Click on the required button to select the Sampling technique you need.

**ROI**

ROI or Region Of Interest relates to the rectangular portion of the video image that you may be interested in. You will lose your Dark Field using this control.

When you are recording video images of planetary objects, the size of the video can grow very quickly. The ROI allows you to instruct MallincamSky to only show and save a specific area of the screen (a smaller region that just contains the image of the planet as indicated by a blue rectangle). This has 2 benefits: smaller files sizes, and as an added bonus, will allow for a faster frame rate.

The ROI command only works while the SkyRaider AG1.2C is in Video Mode but, see below for a work around.

When selected, a Blue Rectangle will appear over your Video Window. You can adjust it using the Left-Click-Hold and Drag technique, or Left-Click-Hold and Drag to place it over a specific portion of your Video Window.
Once you have resized and placed the Blue ROI Rectangle on your Video Window, Left-Click on the Apply Button to selection this as the New Video Window. Then the Next Refresh will fill in the ROI window.

You can then resize the New Video Window by either the Drop-Down Size command in the MallincamSky Tool Bar or by scrolling the wheel on your mouse (if your mouse has a scroll wheel).

This command allows you to Zoom in on a specific area of your original Video image.

If you (or the SkyRaider Camera) ever get confused with what settings you have entered into the ROI control, you can reset the ROI to its full screen by Left-Clicking on the Default Button. You may need to set Fit to Window in the Drop-Down Size command in the MallincamSky Tool Bar.

If you are trying to improve the frame rate (frames per second) when viewing planetary objects. By selecting a Region of Interest around the planet will allow MallincamSky to only capture that ROI portion of the whole image. As a result, the frame rate will dramatically increase.

![Region of Interest (ROI) Example](image)

Work around for using ROI when in Trigger Mode.

- While imaging in Trigger Mode, frame your object of interest in the Trigger Mode screen using the ROI’s Blue Rectangle.
- Click on the STOP Button to stop the Looping (yes, you will lose the image from Trigger Mode, especially if it was a Deep Sky Object).
- Click on the Apply Button in the Region of Interest’s open tab to select the area frame by the Blue Rectangle.
- Start Looping in Trigger Mode by clicking on the Loop Button; your object will be in a ROI.

To Return to Default ROI, Click the STOP button to stop the looping, and hit the ROI Default Button, then back to the Trigger Mode, and start Looping again.
A **Histogram** illustrates how pixels in an image are distributed by graphing the number of pixels at each color intensity level. The **Histogram** shows detail in the shadows (shown in the left part of the histogram), mid-tones (shown in the middle), and highlights (shown in the right part).

A **Histogram** can help you determine whether an image has enough detail to make a good correction.

The **Top Window** in the expanded **Histogram Control** shows the **Histogram** of current active video.

Two vertical **line markers** (white) show the **upper** and **lower** limits of the intensity levels. These markers can be dragged with mouse (**Left-Click-Hold and Drag**), or you can enter in specific values to place the vertical Line markers.

You use the Histogram to aid you in determining the best exposure value for your particular object. But try not to get too aggressive, as you can easily clip (remove) important data from your image.

If you are looking at a color image, the **Histogram** will reflect the **RGB** (**Red**, **Green** and **Blue** channels histogram at the same time) values with shading of the same color. You can also use the **Pull-Down** to select the **Histogram** for just the **Red**, or just the **Green**, or just the **Blue** channel.

You can also enter directly the desired values in the **Left** or **Right** boxes below the **Histogram chart** for both **Left** and **Right** Histogram boundaries.

**Left Click** on the **Defaults Button** to return the **Left** and **Right** Histogram boundaries to their original settings.

**Left-Click** on the **Auto Button** to automatically locate the **Left** and **Right** boundaries thus letting MallincamSky determine the best video quality.

Google Search “**CA DS23Plus Test 2016 03 11 2**” to watch **Chris Appleton** play with the Histogram during a live broadcast.

Set the exposure so that the **Peak of the Histogram** is some place between 50 and 100.
To illustrate what you can do with the Histogram, I have (thanks to Jim Meadow’s amazing images) included some before and after pictures.

- **Increasing** the **Left** Bar *DARKENS* the image
- **Decreasing** the **Right** Bar *BRIGHTENS* the image

The Before image is a 3 second exposure with **Left at 0** and **Right at 250**

![Before Image](image1.png)

The After image, same 3 second exposure, with the **Left at 3** and the **Right at 50**

![After Image](image2.png)

Notice that in both Histograms, the data was **mostly** to the left. This tells we have some exposure room the play with. Don’t forget **Gain** and **Brightness** also has a role as well.
Dark Field Correction

What makes the Mallincam SkyRaider series of cameras unique is the built in ability to take Dark Fields.

The best explanation of what a Dark Field is came from Simon Hamner. See Appendix for his explanation.

To have the SkyRaider camera to automatically apply Dark Fields, you need to follow the following procedures before imaging.

1. Select SkyRaider Camera
2. Select Exposure Time
3. Take Dark Fields
4. Check Enable Box

Select the SkyRaider AG1.2C from the Camera List in the Camera Tab.

Select an Exposure Time for Dark Field Correction

With the Camera Tab selected on the Left SideBar, Left-Click on the Capture & Resolution. The Exposure & Gain Window will expand select the exposure time for the Dark Field.

You must determine what you believe will be the maximum exposure for this session. As, you will create Dark Field’s with this time (or close to it). Also, to want to try to match the other settings in the AG1.2C in the Dark Field as you would have when imaging the Object.

If you are taking a maximum exposure under 5s, then select Video Mode, but since most Deep Sky Objects will require an exposure of over 5s, choose Trigger Mode.

Either enter in the time into the appropriate boxes, or use the up and down arrows beside the chosen Exposure time unit to set your maximum time.

To start the SkyRaider AG1.2C taking continuous exposures, Left-Click on the Loop button.
Take Dark Field Correction

Ensure that the cover is either on the SkyRaider Camera or the Telescope itself is covered, then Left-Click on the Dark Field Correction Line.

The Dark Field Correction Line will open up allowing you to select the Quantity of Dark Fields and the option to start the Dark Field Capture process.

Select up to 99 for the Quantity, then Left-Click on the Capture Button. The Software will display its progress above the selected Quantity. Remember, it is beneficial to set the Dark Field exposure time greater than the longest time you will be imaging at.

As the Dark Fields are being exposed, you can watch the exposure counter in the Dark Field Correction Tab go up, and on the bottom right side of the MallincamSky window, you will see a counter letting you know how long is left in that particular exposure.

Once you have finished taking your Dark Fields, don’t forget to remove the lens cap on your camera (or Telescope), so that you can actually image (I won’t mention any names...).

Once you have collected your Dark Fields, you can then save them with the Export Button (choose a location and File name that allows you to locate the correct Dark Fields if you would like to reuse them. Name the folders so that it is easy to retrieve Dark Fields that match for current imaging plan (60s times 5). You can load previously saved Dark Fields via the Import Button. Just browse to the folder where you saved them when you used the Export Button.

To activate the Dark Field’s just Left-Click in the Enable check box in the Dark Field Correction’s box to have Dark Fields applied in real time to your images.

To image without using Dark Field’s, just uncheck the Enable checkbox.
**Live Stack**

MallincamSky comes with the ability to stack images to improve the signal to noise ratio. This feature will allow you to stack short exposures to produce an image that otherwise would of required a larger exposure time. This common allows users whose equipment will not all for long exposures (such as Alt-Az Mount), but can also be very beneficial to all mounts.

The following images captured live illustrate the advantages of Stacking:

- **M5, a single** 5 second exposure using SkyRaider AG1.2C on 10" VRC.
- **M5, two** 5 second exposures stacked using SkyRaider AG1.2C on 10" VRC.
- **M5, three** 5 second exposures stacked using the SkyRaider AG1.2C on a 10" VRC.
- **M5, four** 5 second exposures stacked using the SkyRaider AG1.2C on a 10" VRC.
- **M5, five** 5 second exposures stacked using the SkyRaider AG1.2C on a 10" VRC.

Left-Clicking on this command will open up the **Live Stack Window**
Here you can activate the stacking by check-boxing the Enable, you can have MallincamSky Align the frames by checking the Align Frames Box. You can select the number of frames you would like stacked in the Number Box. You can tell MallincamSky if you would like the images Stacked (made brighter), or Meaned (made sharper), plus indicate is you are stacking Planets or Deep Sky Objects. This command will provide a live status of its stacking process in this Window.

First select the object Type (Planet or DeepSky)

Now select if you would like the images Stacked (added) or Averaged (Mean) by making a selection in the Mode Box.

Next enter in the Number of Frames you would like stacked. You can stack from 1 to 99 Frames

Now determine if you would like the Stacking process to Align the Frames. This will produce a better Image but will take a bit longer. The process examines the image and determines alignment stars for the process. If there isn’t enough alignment starts the command will indicate that there is a problem, and you may need to increase the gain or exposure to produce more stars for the alignment routine.

If you would like the stacking to align the frames, then checking the Align Frames Box.

Start the Stacking by checking the Enable Box.
The stacking process will keep you informed with its status by indicating you what the current **input** stacking number is, what the current **output** (how many frames are stacked), and via the status, if there are any issues.

If you told MallincamSky to stack 5 images, then when the 6\textsuperscript{th} image is taken, it will keep displaying just the last 5 images stacked (the first image will be removed, this is a rolling stack).

You can disable the Stacking process by just unchecking the Enable Box.

Don’t be afraid to also turn on Dark Field Subtraction to help eliminate the background noise.

If the Status tells you it has an alignment failure (Not enough Stars), then just increase the gain. This should make more stars available to the alignment algorithm.

### Cooling

The Mallincam SkyRaider AG1.2C comes with a Fan that can aid in cooling the camera when conditions are getting warm. The SkyRaider’s default setting is for the Fan to be **ON**, but you can manually turn it **OFF** by using the Slider on the Cooling Tab.

The **TEC** command is not implemented in this version of the camera.
Parameters

The Parameters control allows you to:

**Load** a previous set of camera control parameters, or **Save** the current camera control parameters for another session. The parameters includes most of the settings in the SideBar including the Rectangle Regions of Interest.

The Drop-Down control provides a list of previous (if any) saved parameter settings. Just select the parameter session that you require from the list.

Left-Click on the **Load** command and it will load the control parameters from the above file in the Drop-Down List.

Left-Click on the **Save** command and MallioncamSky will open a window that will allow you to give a name to the current sessions, and then will save the current camera parameters under that name (see **Management command** below).

Give a **Name** that is easy to determine what the parameters in the file contain. That is, choosing a name like *Eagle Nebula Dark Skies*, would indicate that the parameters in the File are designed for the Eagle Nebula when you have great dark skies.

Left-Click on the **Overwrite** command and it will overwrite any setting changes you made to the current parameter file.
Left-Click on the Management command and a Management Dialoge Window will open up.

This Dialog Window will allow you to:

- Rename the Parameter File name
- Remove the Parameter File from the computer
- Re-order how the Parameter names appear in the list.

The Management Dialog will also allow you to export all of the Parameter Files to a *.pgt file, so that you can send this *.pgt file (which contains all of your parameter files) to a colleague.

The Management Dialog will also allow you to import a colleagues set of parameter files (single *.pgt file which contains all of their parameter files) into your MallincamSky folders.

When you import a set of parameter files into your system, it will overwrite all of your parameter files. So use caution. See Hint below.

After you have created a list of parameter files that you are using, Save them in a Parameters File Folder (pick a location and name for This Folder such as Parameter Files) on your computer under a name that indicates that these files are yours (such as Michael’s SkyRaider-AG1.2C Parameters Files for New Hamburg).
This way you can save a another set of parameter files for another SkyRaider Camera in the same folder (Parameters File Folder) this way you can load parameter files for a specific camera. Also you can also include other colleagues parameters files in the same Folder (Chris’s skyRaider-AG1.2C Parameter Files for Toronto). This allows you a method to reload your parameter files after trying colleagues (and not have them overwritten).

### Parameter File Folder

- Michael’s SkyRaider-Dsc Parameters File for New Hamburg
- Michael’s SkyRaider-AG1.2C Parameters File for New Hamburg
- Michael’s SkyRaider-Dsc Parameters File for Mount Forest
- Michael’s SkyRaider-AG1.2C Parameters File for Mount Forest
- Chris’s SkyRaider-Dsc Parameters File for Toronto
- Chris’s SkyRaider-AG1.2C Parameters File for Toronto

### Michael’s SkyRaider-AG1.2C Parameters File for New Hamburg

- Eagle Nebula Dark Skies
- Eagle Nebula Light Skies
- Focus and Go to Parameter

### 7. Installing Optional Software

Visit the Software Downloads Page in the Support Tab located on the website: www.mallincam.net
Select the Blue Click Here Button to download the Drivers and MallincamSky Software for a Windows PC (there is a Click Here that contains a ASCOM drivers as well as DSHOW and TWAIN Drivers).

After you have clicked on the Blue Click Here indicator, a zipped file will be downloaded onto your computer.

If you have a Mac, or Linux computer, just choose the appropriate download form the download page. The following instruction will represent a Windows Computer.

Place your mouse on the zipped file, Right-Click to pop-up an Action Window, and choose Extract All …

A Select Destination and Extract Files Window will open-up. Just Click on the Extract button to accept destination location. The Destination Folder will now open-up the actual folder that contains the software to install.

Double-Click on the folder to open it up, revealing the MALLINCAMSKYSetup program it contains.

Double-Click on the appropriate Setup program to install it (make sure Mallincam SkyRaider is NOT plugged into USB Port when installing software).

The MALLINCAMDshowSetup contains the Direct Show Drivers for the camera
The MALLINCAMSKYSetup contains the camera control software.
The ASCOMMallincamSetup contains the ASCOM driver for the camera.
Installing DirectShow Driver

Step 1
Double-Click on the MALLINCAMDshowSetup File

Windows may display a warning asking for permission to run the program, if it does, select YES

The following MallincamSky Setup Screen will appear:

Step 2
Click on Next to start the installation process.

Step 3
Click on Install to start the installation process.
Click on Finish to close the process.

The DirectShow driver will give you the ability to display the SkyRaider video using other video display software. The software that uses the DirectShow video protocol, will always have a button that pops up the DirectShow Control Window where you can control the exposure, and other settings on the SkyRaider camera.

### Installing WDM Driver

**Double-Click** on the MALLINCAMTwainSetup File

Windows may display a warning asking for permission to run the program, if it does, select YES

The following MallincamSky Setup Screen will appear:

![MallincamSky Setup Screen](image)

**Click** on Next to start the installation process.
Click on **Install** to start the installation process.

![Installation screenshot]

**Step 4**

Click on **Finish** to close the process.

The **WDM** driver will give you the ability to display the **SkyRaider** video using other video display software. The software that uses the **WDM** video protocol, will always have a button that pops up the **WDM Control Window** where you can control the exposure, and other settings on the **SkyRaider** camera.

---

**Note**
Installing Mallincam ASCOM Driver

Visit www.Mallincam.net

Select the Support Tab

Go into Software Downloads

Near the bottom of the page under MallincamSky Downloads is the SKYRAIDER ASCOM DRIVER link

Download the SKYRAIDER ASCOM driver (ascommallincamsetup.exe)

**Note**
You must have already installed the latest ASCOM Platform on your computer (www.ascom-standards.org).

Double Click on the Driver to install it onto your computer system (Windows).
Depending upon the version of Windows, the following screen might appear.

Click on the Run Button. The following Window should now Pop-Up.
Click on **Next** to Continue. The **License Agreement Window** should now appear.

Step 6

Click in the ‘I accept the agreement’ Radial Button, then **Click on Next**. The **Ready to Install** Window will appear.

Step 7

**Click** on Install to install the ASCOM Driver. Depending upon the version of Windows, you may see the Following Pop-up. **Install** it.

Step 8

That’s it. The installation process will provide you with the final Pop-up window to inform you that the installation was successful. **Click** on the **Finish Button** to acknowledge.
8. **AutoGuiding with SkyRaider**

**Guiding with MaximDL and Mallincam ASCOM**

The following is a pictorial procedure on how to select the `Mallincam ASCOM driver` (assumes you have already installed this driver on your computer) in MaximDL.

**Step 1**

Start MaximDL

**Step 2**

**Left-Click** the **Toggle Camera Control Icon** *(Camera Control Window will open up).*
**Step 3** Left-Click the **Setup Camera** button on Camera 2 from the **Setup Tab**.

**Step 4** Choose **ASCOM** (from **Camera Model** in **Setup ASCOM** popup Window)

**Step 5** Now Left-Click on the **Advanced...** Button in the **Setup ASCOM** popup Window. This will pop up the **ASCOM Camera Chooser** Window.
Choose **ASCOM Mallincam Driver** from the pull down selector.

**Left-Click** on the **OK** Button to accept the Mallincam Driver in the **ASCOM Camera Chooser** Window. You will be returned to the **Setup ASCOM** window, then **Left-Click** on its **OK** button to accept this, and you will be returned to the **Camera Control** Window.

**Left-Click** on the **Guide Tab** to switch to the Guide Options screen.
Left-Click on the **Settings Button** in the **Guide Tab**, and the **Guider Settings** Window will pop up.

Select **Guider Relays** in the **Autoguider Output Control** pull down selector.

![Guider Settings Window](image)

Left-Click on the **OK** Button to accept the settings and return to the **Camera Control Window**.

All you need to do now is select **Connect** from the **Setup Tab** to activate the camera and start using MaxIm-DL as you normally would. Remember that MaxIm-DL control the **exposure** via the **Seconds selector** in the **Guide Tab**.

**Note**

In the **Guide Tab Options** display, you can use **Camera Settings** to adjust a few of the SkyRaider’s settings such as **Bit Depth** and **Gain**.
Guiding in PHD2 with Mallincam ASCOM Driver

Start the PHD2 software.

Click on the Connection Icon to open up Connect Equipment Window.
Choose **ASCOM Mallincam Driver** from Camera Drop Down List.

![ASCOM Mallincam Driver selection](image)

**Step 4** Left-Click on the **Camera Setup Button** to open Setup Window.

![Camera Setup Window](image)

**Step 5** Setup Recommendations for SkyRaider is to use **640 * 480 Resolution** with the **8 Bit Depth** and **Low Frame Rate**. Left-Click on **OK** to go back to Connect Equipment Window.

![Setup Window](image)

Don’t be afraid to adjust these settings to match your requirements.
**Left-Click** on the **Connect** button on **Camera List** to connect camera.

![Camera List Connect button](image)

**Step 7**

Select **On-Camera** from the **Mount Dropdown list**

![Mount Dropdown list](image)

**Step 8**

**Left-Click** on the **Connect** on **Mount List** and select **On-camera** to tell PHD2 that the mount that the **SkyRaider** controls the ST4 port itself.

![Mount List Connect button](image)

**Step 9**

**Left-Click** on the **Close** to close the **Connect Equipment Window**.

![Connect Equipment Window](image)
**Step 10**

**Left-Click** on the **Looping Icon** to start the **SkyRaider** imaging and then start using **PHD2** as you normally would. PHD can control the exposure time of the SkyRaider Camera with the exposure drop down button.

If you are using a Mallincam **SkyRaider AG1.2C** camera to do your auto-guiding with PHD, and you are using another MallinCam camera, say the **DS** model, for imaging in **MallincamSky**, then: **Connect the Guide camera with PHD first**, followed by connecting the **DS** model to **MallincamSky**.

![Image of PHD2 Guiding 2.60 - My Equipment window with Looping Icon highlighted.](image-url)
Running PHD2 with WDM Driver + ToupST4 Driver

Step 1
Start PHD2 software

Step 2
Click on the Camera Icon to open up Connect Equipment Window.
Choose **WDM-style webcam** camera from Camera Dropdown List.

**Step 3**

**Step 4**

*Left-Click* on the **Connect button** on Camera List.

**Step 5**

The **Camera choice** window will pop-up. Select **MALLINCAM** and **Click** on **OK**.
Select **Resolution** (recommend **640x480**) and Click on **OK**

Choose **ToupST4 (ASCOM)** from the **Mount Dropdown List**
You can check to see if the SkyRaider can control your Mount by Left Clicking on the Mount Setup Icon and use the Arrow Buttons to see if your mount moves.

**Step 8**

Left-Click on the Mount Connect Button activate the connection.

**Step 9**

Click on Red X to close the Connect Equipment Window.
Left-Click on the Looping Icon to start the SkyRaider imaging.

Since WDM is only a Video image from the SkyRaider, you will need to set the PHD2 Exposure Duration to a value other than AUTO (say 1 second). This will NOT control the actual exposure rate of the SkyRaider, but rather show what the SkyRaider has on its video image every 1 second. Left-Clicking on the Cam Dialog Box (see image above) in PHD2 will open a window where you can adjust the parameters of the SkyRaider Camera (such as the actual Exposure, as the Exposure control in PHD2 does not control WDM driver’s actual exposure, but rather just the refresh rate). If you can, set both the Actual Exposure and the PHD exposure duration to the same value (experiment).

If you see a rectangular Box in your Window, go to the ROI Tab in the Cam Dialog Box, and move and shrink the box to one side of your window so it doesn’t affect the image.
9. Appendix

Imaging in SharpCap

With the addition of the SkyRaider Direct Show Driver, you can control the SkyRaider with a variety of other pieces of Software such as SharpCap. Now this is the first generation of DirectShow/SharpCap driver interaction and as such, not all of the commands are perfect for user control.

SharpCap can be obtained at [http://www.sharpcap.co.uk/](http://www.sharpcap.co.uk/)

Start SharpCap

Choose Cameras from the Top Heading Tab, then in the DirectShow Cameras, pick MALLINCAM.
Once you have selected, the Mallincam Directshow Driver, SharpCap will display what the SkyRaider is imaging.

The controls on the right of the screen (Exposure, Gain, Gamma, ...) allow you to change the settings of the SkyRaider.

It takes a bit of practice to become familiar with the settings as these are more generic controls, the majority of the controls have their own scales (the exposure does not indicate seconds, but has an equivalent range from 0 seconds to 5 seconds). You will need to record those numbers to assist you.

SharpCap recognizes that the AG1.2C does have an extended mode for exposures that are over 5 seconds.

To turn on the extended mode (over 5 seconds), then enable the LX Mode in the Options Tab on the Top of the screen. This lets the exposure slider now provide exposures over 5 seconds (even though you don’t actually see the time on the slider). Disable LX mode to return to 5 seconds max exposure.

SharpCap has the ability to Pop-Up the SkyRaider Video Filter (DirectShow control window). Click on the Show Button in the Video Capture Control.
The Pop-Up Window gives you some familiarity with settings as it provides you with more comfortable units (exposure time in ms).

You can choose the Exposure Tab in the Filter window to slide the Tab to match the exposure time in ms (divide by 1000 to get seconds).

You can also Click on the Time setting on the right of the Slider to Pop-Up a window that allows you to directly enter in the time in ms.

You can also control the Gain in the window.

The other Tabs in the Window will also you to adjust other settings in the SkyRaider Camera.

Once you are comfortable with the settings, Click on the OK Button in the Properties window to close it.

SharpCap will start the imaging process and will, on the bottom of the window, display information about the exposure and remaining time. You can watch the green status bar move to the right as the exposure is being taken.
How Do I …

How do I get rid of the Green Exposure Rectangle?

First remember the Green Exposure Rectangle is used for the auto-exposure process, but it can be annoying when you are imaging.

- The way to remove it from the Video Window is to uncheck the auto-exposure box.

If you require the Exposure & Gain Control to be expanded and auto-exposure turned on, but still do not want the Green Rectangle in the middle of your screen, try this.

- Chose Fit to Window from the Zoom Drop down Box (on the Icon Tool Bar). Now just drag the Green Rectangle (Left-Click and Hold technique) to the lower left of the window.

- Next grab one of the corners of the Green Rectangle and drag it to the matching corner of your Video Window. Next, grab the opposite corner of the Green Rectangle and drag it to the same location as the first corner. This will make a zero size rectangle.

How do I Select a part of the Image and Zoom in?

- In Video Mode, expand the ROI control (a Blue Rectangle should appear around you image). Using the Left-Click Hold and Drag technique, maneuver and size the Blue Rectangle so that it encloses the area you are interested in. Left-Click on Apply and watch the part of the image in Blue Rectangle, be the whole image in the Video Window.

- Now, Left-Click in the Blue Rectangle, and use the scroll wheel on your mouse to enlarge or reduce the image (you can also use the Fit to Window control on the Icon Tool Bar).

- Left-Click on Defaults to get back to Full screen.

- See ROI section in Manual for creating an ROI in Trigger Mode.
How do I automatically save 1 image every 30 seconds?

- Choose the **Time-Lapse (Auto Capture)** from the **Capture Menu** on the **Top Menu Line**. Now determine your naming convention and location.
- Enter **30** in the **Time slot**
- Enter the total number of images you would like (or leave unchecked, and you will manually stop the process when you are ready).
- **Left-Click** on **OK**

At the bottom of the MallincamSky Window; a running count will be displayed.

- **Left-Click** on **Stop Time-lapse (Auto Capture)** to stop the process.

How do I adjust the brightness in my monochrome SkyRaider?

You will have noticed that the **Brightness** command in the **Color Adjustment** control is deactivated. You can use the **Gamma** command (moving it to the left will brighten the whole image, but the better control is the **Histogram** command in the **SideBar**.

By move the **Left Marker Line** or the **Right Marker Line** (or a combination of both) to the left will brighten up your image in a more controlled manner.

How do I Broadcast my image onto Night Skies Network (NSN)?

As a direct way is not yet available, you will need to use a third party software to assist you.

Obtain one of the following: **ManyCam**, **WebCam Max**, **SplitCam** (different opinions on which is the best, it becomes a personal preference). Each of these software programs will allow you to capture what is happening on your computer screen. The software packages also act as a webcam to NSN.

Therefore, whatever screen image these software packages are capturing, will display on NSN as a webcam image.

See **Setting up to Broadcast on Night Skies Network** in the **Appendix** for more detailed instructions.

Can I Use MallincamSky with One SkyRaider and Auto-Guide with another?

Yes, as long as you use **DirectShow**, **WDM** or **ASCOM** with the second **SkyRaider**.

Remember if you are using **DirectShow** or **WDM**, the guiding software CANNOT control the exposure setting on the camera; look for a **Settings** or **Property Tab** button that pops up the **SkyRaider** exposure control window.
How Do I Pause the Video?

You can Pause or Resume the live video by either choose Setup->Pause from the Top Menu Line, or even easier, just press on the pause key on your keyboard.

How do I Undo an Operation?

On the SideBar, there is an Undo/Redo Tab; Just Left-Click on the Tab and the Tab will open with a list of all the operations you have performed on your Image (not Video, you cannot undo video operations such as contrast).

Just Left-Click on the location before the operation you would like to undo and MallincamSky will revert the image back to that step.

How do I make my ROI the whole Image Again?

Just Left-Click on the Defaults Button in the SideBar’s ROI control. Note, by changing the ROI, the Dark Fields will be removed from the SkyRaider.

How do I Turn Off Dark Field correction?

Just Left-Click in the Enable box to remove the check mark in the Dark Field correction control on the SideBar. Place a check mark back in the Enable box to reactivate Dark Field correction.

My ROI Window is Black?

You must wait until the next exposure until the ROI Window gets filled.
First Aid for the SkyRaider Series

When I click on the SkyRaider camera from the Camera list, a message pops up saying Failed to Start: SkyRaider

There is an issue establishing fulltime communications with the camera. This can occur for a variety of reasons but the most common one is the cable is too long for the USB port on that specific computer to establish the correct timing protocol. This is more so with USB 2.0 devices.

**Recommended solution:** if you need to use a longer length of USB 2.0 cable for the AG1.2C, then there are two options:

- Connect a **powered USB 2.0 hub** to the computer and connect the USB cable between the hub and the SkyRaider camera.
- Connect an active (not passive) USB 2.0 extension cable between the camera and the included USB 2.0 cable. Something along the lines of the Tripp-Lite USB 2.0 superSpeed Active Extension Repeater Cable.

When I try to connect I receiver message “Catastrophic failure (Exception from HRESULT:0x8000FFF(E_UNEXPECTED))”

This message indicates that something has blocked or overwritten the driver. Installing another driver or even a major Windows update has played havoc with the original SkyRaider Drivers.

**Recommended Solution:** Uninstall the current driver through the Control Panel (or if you cannot find it in the Control Panel check out the c:/PROGRAM FILES/MALLINCAM/MALLINCAMSKY folder, there is a program called uninst. Double-Click on uninst to uninstall MallincamSky and its drivers).

Once uninstalled, reboot your computer, then reinstall MallincamSky again. This should fix the issue.

All I see is a White image

**Recommended Solution:** Move Gain to the extreme Left (1). Ensure automatic exposure is off. Make sure you are in Video Mode. Move exposure to minimal value say 10ms. Now slowly cover telescope to see if image darkens up to black as you completely cover up the telescope. If this occurs, then SkyRaider is working properly so you need to check your telescope and focus setup.
Dark Field Explanation

The following is the best explanation of what Dark Field is, and it comes from the work of Simon Hanmer.

Dark Frame vs Dark Field

Dark Frame Subtraction

First, take an image with the camera shutter closed or the camera/scope covered under the same conditions of exposure time and temperature as the light frames you are going to capture of your astronomical target. Many astronomers will take ten or more such dark frames and then combine them into a master dark frame, principally for statistical reasons: the more sub-frames, the better quality of master frame.

This will give you a single (master) frame of hot and warm pixels generated in the imaging chip, electronically and thermally, including amplifier glow.

Second, subtract the dark frame from each of the light frames in order to remove hot and warm pixels and amplifier glow. However, other noise will remain and needs to be removed with other manipulations and software.

Dark Field Correction

Dark Field correction is another matter entirely. It does not refer to a single image and the recommended/default 10 frames captured to perform the Dark Field correction are not used to generate a master frame – nor are they simply subtracted from the light frames.

Instead, the 10 frames are first used to perform a running stacking, analogous to the stacking procedure applied in both the SSI software and the new Universe/SSI software.

Running Stacking: the first frame in the series of 10 is recorded in the camera as is. Then the first and second frames in the series of 10 are combined to form a new frame that is also recorded. Then the third frame is combined with the preceding 2 frames to form yet another combined frame that is also recorded ... and so on until you end up with 10 frames in a series that represent 1, 2, 3, 4, 5, 6, 7, 8, 9 and 10 combined frames, respectively.
Note that stacked and combined frame #10 represents information derived from all 10 frames.

But hold on … we are not talking CCD imaging here – this is video. When a CCD chip is activated it cranks at full blast and requires effective cooling to prevent it from rapidly heating up beyond a user-determined temperature. But video chips work differently; they heat up slowly and progressively. This means that the first frame of the series of 10 was taken at a lower chip temperature than the final one. Therefore, each of the 10 frames records different levels of thermal noise. In other words, when stored in the camera, these 10 combined frames represent a library of information that the camera and software can now choose from and use to CORRECT (note: not « subtract from ») the light image that we want to display on our computer screen.

Now, how does this work in practice – and why is it called a Dark Field correction?

The Dark Field correction is prepared by the user at the beginning of an observing session by covering the camera or scope, pre-determining the exposure time and setting the software to automatically taking up to 10 images. We all know our equipment and the skies we observe under (or we certainly will with a bit of practice). We also have an idea of what range of filters we might use that night and the effect they have with respect to exposure times. Take this into account when selecting your exposure time for your 10 dark images.

But remember: this is NOT a Dark Frame subtraction – the exposures required for dark frame subtraction must be close to those used for the light frames of our astro-targets. Not so for Dark Field correction. The camera and software in the latter case are not looking for a single FRAME to subtract based on exposure time. They are looking at the 10 combined frames to see which one has the noise level that most closely matches the noise level in the light frame itself. In other words, they are looking for a noise FIELD. The point here is that camera and software will select the appropriate Dark Field for the correction, for both shorter and longer light frame exposure times from the same « library ».

In addition, unlike the single frame of a CCD dark frame, the images used for Dark Field correction are interlaced combinations of odd and even scan lines. Apparently this too factors into the fact that this correction removes ALL NOISE, not just hot and warm pixels.

The important point to retain here is that, because of the stacking and combining to form the library of images for the correction procedure, long light exposures do NOT require similarly long exposures for the Dark Field correction images. For example, a 2-minute light exposure using a narrow-band h-alpha filter may still only require the user to prepare ten 30 second dark images for the dark field correction. The precise numbers will vary with your equipment and conditions.
The two screen captures below demonstrate the difference that applying a Dark Field to an image can provide.

90 second exposure, lens covered. **No Dark Field Applied**

90 second exposure, lens covered. **10 Dark Fields Applied**
Setting up to Broadcast on Night Skies Network

Introduction

I found that when I first started connecting tonight Skies Network (NSN), things started happening too fast for me to keep track of everything at once. So, pre-planning was the most the most crucial step for me. I found that by doing test runs in the comfort of my house allowed me to develop my techniques that work for the equipment and software that I use. Below are the results and steps that I use to broadcast on NSN, feel free to follow them and/or made modification as you deem as necessary.

Computer real-estate will be your nemesis. So, depending upon the size of the monitor (laptop), then number of screens that you are using, then number of software programs that using are simultaneously are using, will dictate how you will manage your windows. I will describe how I have organized my windows under a variety of situations (1 computer, 1 computer with 2 monitors, which software packages am I using, and what am I trying to do this session). Remember, it’s all about having fun, and time and patience are your best friends (not to mention all the guys and gals, and the Yahoo – Mallincam site:

http://tech.groups.yahoo.com/group/mallincam/messages

One of the most important decisions you will need to make with broadcasting the image of the SKYRAIDER is what Video capture software are you going to use. Some simple suggestions:

Currently MallincamSky is not capable of modifying the Video Image and having that Video Image be directly captured by NSN Flash. So if you want to use all the features of the MallincamSky software and broadcast those results, as well as save screen shots and videos of your images, then we need another program to capture MallincamSky’s output and have the output from that program linked to NSN’s Flash grabber.

You currently have three choices for that other program: Splitcam, Manycam, WebcamMax. All three have about the same features, some of these have versions that will cost you, but all have a version that is free (reduced functions, advertisements, etc…). My current program of choice is Splitcam (I can live with the Advertisements). You will then use Manycam/Splitcam/Webcam Max along with MallincamSky Software to broadcast the images on NSN.

Plug in the SKYRAIDER camera into an USB port on your computer.

Always use the same port for your connected devices. I even mark on my laptop which USB port is for which device.
Start MallincamSky

Get the image of your object on the Image Window of MallincamSky, adjust the settings on the software for your planned object and size the window so you have room for other software on your monitor real-estate. If you have a dual Monitor system, move MallincamSky to the second monitor.

During your initial NSN experience, you will find it easier to even get the object of interest onto the MallincamSky Software window. This allows you to spend some time playing and adjusting the settings prior to connecting to NSN. As you become more comfortable, you will not worry about that and will adjust while connected to NSN (with the whole universe watching you live).

Start Manycam/Splitcam/WebcamMax

Size the Manycam/Splitcam/WebcamMax window so that is beside the MallincamSky Window and you can see both with little overlap. If you have a dual monitor system, you can slide both the MallincamSky Software Window and the Manycam/Splitcam/WebcamMax window to the second monitor.

Have Manycam/Splitcam/Webcam Max grab the window image

All of these packages have the ability to get a desktop image. Choose this option and overlay the sizing window on top of your MallincamSky Software Image Window. You may need to play with the sizes until you obtain the ideal combination of both the fit in your screen. You want to ensure that you get a good image of whatever the MallincamSky Software is looking at inside the Manycam/Splitcam/Webcam Max window.

This allows you to select the size and location of the desktop that you want on the SplitCam. Just slide and adjust the overlay on top of your MallincamSky’s Software image.
Step 5

Adjust the Resolution and frames/second (fps) value on Manycam/Splitcam/WebcamMax

This will be trial and error; it all depends upon resolution, bandwidth, and what over members on NSN experience from your broadcasted image. You will end up adjusting both on the Manycam/Splitcam/Webcam Max side as well and on the NSN side to get the best image. A helpful hint: I slide over the Manycam/Splitcam/Webcam Max window so that some of the text appears in the Manycam/Splitcam/Webcam Max window. Can the members on NSN read the words? If not, adjust. Remember, this may take a couple of sessions until you obtain the ideal resolutions for your particular setup. For me I have set both Manycam/Splitcam at 640 x 480 at 15 fps.

Step 6

Minimize the Manycam/Splitcam/WebcamMax software window

Click on the little underscore on the top right side of the Manycam/Splitcam/Webcam Max window. This will eliminate the Manycam/Splitcam/Webcam Max window from your desktop (it should now appear on the bottom of your desktop monitor), but note that the software is still running and still has hold of your desktop (MallincamSky) Image location.

Do not move the MallincamSky Window around your desktop when broadcasting, since Manycam/Splitcam/WebcamMax is just grabbing the real-estate location that currently your MallincamSky Software image is situated at. If you move the MallincamSky Software Window, then Manycam/Splitcam/Webcam Max will still grab the desktop location, but may not grab the whole MallincamSky Video Image. Don’t be afraid to practice moving the MallincamSky Software window when not broadcasting to learn how it affects the displayed Manycam/Splitcam/WebcamMax Window. If you need to, you can again use the Manycam/Splitcam/WebcamMax desktop select icon and select or change the location or size of the window for it to grab.

If you have a dual monitor, you can leave the Manycam/Splitcam/WebcamMax window open on the second monitor since real-estate will not be an issue in the situation. In fact with Splitcam, you have an option to view the displayed image in full screen mode by clicking on the “[]” symbol in the upper right side of the screen (the escape key returns you back to normal size).

Step 7

Start your Web Browser of Choice

You may have to play with a number of Browsers to see which one works well with your particular computer setup. I have had success with many browsers: Chrome, Internet Explorer, Firefox, and Maxthon.
Log into Night Skies Network (NSN)

Have your Web Browser go to the location: http://www.nightskiesnetwork.ca/. Locate and click on the BROADCASTERS AND MEMBERS SIGN IN button. The next Login screen will ask you to enter your username and password. You will next be presented with the Channel Line Up screen for Night Skies network. Click on the Login selection on the upper right hand side of the screen.

You will be presented with the Channel Launch Sign In screen for NSN. Again enter your Username and Password and click on Publish Channel button.

Allow Adobe Flash to use your Manycam/Splitcam/WebcamMax

The Adobe Flash Player Settings window will pop up on your screen asking you for permission to use your camera and your microphone. Select Allow.
**Turn off your Microphone**

Until you have your microphone figured out, it is best to initially turn it off. If you do not, the viewers on NSN may hear an extreme loud buzzing (feedback noise). Later on we will look at using the microphone, but until then I recommend **CLICKING** on the little *microphone symbol* on the upper right corner of the NSN video display window to disable the microphone.

![Microphone Symbol](image)

**Set a message for the NSN observers**

It is a good idea to display a message above the NSN display window, so that the other NSN views understand what you are doing. When initially setting up (which usually takes longer when you are learning), I usually type the message “*Setting Up the Camera*” then **CLICK** on the **SEND** button to have it displayed.

![Message](image)

When you are us and running and everything is working as it should, you will change the message to indicate, what telescope, mount, and camera you are using. For that is the most frequently asked question from the NSN viewers.

**Select the Camera**

Now is the time to activate the camera, or in our case have NSN driver point to our Manycam/Splitcam/Webcam Max output.

- **RIGHT CLICK** inside the NSN Video window to bring up a *Settings Window*.
 **CLICK** on the *Settings* choice and you will be presented with the *Adobe Flash Player Settings Window.*

![Adobe Flash Player Settings Window](image)

 **CLICK** on the *Camera Icon* and you will be presented with a *pull down menu* to select your camera.

![Camera Icon](image)

 **CLICK** on the *Pull Down* list to select your camera of choice.

![Camera Pull Down List](image)

 **CLICK** on *CLOSE* to Continue.

**NSN** will remember what camera you chose from the last visit. So usually you only have to go through this process whenever you want to change what camera device you would like the **NSN flash driver** to use.

### Choose your Camera Settings

We will now select the settings for our camera. We have the option of changing: The *Bandwidth*, *Picture*, *Resolution*, *Framerate*, and even the *microphone rate* (when you are ready). The changes will *not be activated* until you **CLICK** on the Green *OK* symbol in the window.

 **LEFT CLICK** inside the **NSN video Window** to bring up the *Camera Settings Window.*

![Camera Settings Window](image)
Use the sliders for Band Width and Picture values. I usually have both of my sliders way on the right. Over time you will find the sweet spot for your system.

Select your Resolution from the Pull Down Menu. Select a starting value of (640 x 480) for the system. Again, play with these to see what settings the NSN viewers say is the best.

Select your Frame Rate. From its Pull Down Menu. I usually leave it at 15 fps, but I have used 30 fps at times. Again trial and error for your system.

CLICK on the green OK symbol to accept these settings.

That’s it, you are done. If everything is working well and the Window’s gods are in a good mood, you should be broadcasting whatever object the SkyRaider is capturing. You should now enter another Message and SEND it out to indicate what system you are using and what object you are viewing.

There is a time delay on what you say (if you have your microphone activated) and do on your computer as compared to what others see (and hear) on the NSN broadcast.

You will freeze (and I don’t mean like what Chris does when he broadcasts in winter till 3am), I mean from time to time your NSN connection will freeze for no apparent reason. It happens to us all. When this happens, you can simply terminate the Web browser program (Ctrl – Alt - Del). Then restart your browser and Log back into NSN. This usual is a very quick process. But, sometime we all have to restart our computer (this takes longer for we need to power down hardware and software) and reactivate everything before login back in. Don’t worry, the NSN viewers sense what is happening and will keep the conversations going while waiting for you to come back on.

Don’t be afraid to ask for advice by typing in on the Video chat window, as we are all learning and are willing to assist whenever we can.

When ready, try activating the microphone (click on the microphone symbol). Other will let you know if they can hear you, or if there is noise. Remember there are settings for the microphone in the camera settings window.

When you are finished with your session, you simply say your good nights to the crowd of NSN viewers to let them know that your session is ending. CLICK on the red STOP button on your NSN Window and NSN will shut down your channel and you can power down your system and call it an evening (It won’t force the NSN viewers off the channel and some viewers will continue chatting long after you have gone to bed).
Focal Reducers

MFR-8 Mk II Focal Reducer

The new MFR-8 was designed for all the MallinCam SkyRaider Series of Cameras. Included are a multi-coated 25mm dual elements hand selected lens assembled right here in our Mallincam facilities. Machining is also done at a local machine shop. It comes equipped with two 10 mm spacers and one 5mm spacer for precision F/ ratio reduction to suit just about any telescope configuration. The MFR-8 is part of our high end MFR-5II which feature precision threads and is ready to accept any filters or 1.25" size. Reduction from 0.55X to 0.39X is achievable (depending upon telescope and lens configuration).
